Magnetic Resonance Imaging of Healthy and Diseased Brain Networks Yong He, Alan Evans, 2015-03-05 An important aspect of neuroscience is to characterize the underlying connectivity patterns of the human brain i.e. human connectomics Over the past few years researchers have demonstrated that by combining a variety of different neuroimaging technologies e.g. structural MRI diffusion MRI and functional MRI with sophisticated analytic strategies such as graph theory it is possible to noninvasively map the patterns of structural and functional connectivity of human whole brain networks With these novel approaches many studies have shown that human brain networks have nonrandom properties such as modularity small worldness and highly connected hubs Importantly these quantifiable network properties change with age learning and disease Moreover there is growing evidence for behavioral and genetic correlates Network analysis of neuroimaging data is opening up a new avenue of research into the understanding of the organizational principles of the brain that will be of interest for all basic scientists and clinical researchers Such approaches are powerful but there are a number of challenging issues when extracting reliable brain networks from various imaging modalities and analyzing the topological properties e.g. definitions of network nodes and edges and reproducibility of network analysis We assembled contributions related to the state of the art methodologies of brain connectivity and the applications involving development aging and neuropsychiatric disorders such as Alzheimer's disease schizophrenia attention deficit hyperactivity disorder and mood and anxiety disorders It is anticipated that the articles in this Research Topic will provide a greater range and depth of provision for the field of imaging connectomics *Automation and Scientific Communication* Hans Peter Luhn, 1963
