Sub-and Supra-Second Timing: Brain, Learning and Development Lihan Chen, Yan Bao, Marc Wittmann, 2016-08-15 Time perception in the range of milliseconds to a few seconds is essential for many important sensory and perceptual tasks including speech perception, motion perception, motor coordination, and cross-modal interaction. For the brain to be in synchrony with the environment, the physical differences in the speeds of light and sound, as well as stimuli from other modalities such as odors, must be processed and coordinated. Poppel Bao et al. 2015 Time is a subjective feeling that is modulated by emotional states which trigger temporal distortions: temporal dilation vs. contraction. Wittmann et al. 2014 hence give rise to subjective time that may be different to event time as initially registered in the brain. Recent research suggests that time perception in a multisensory world is subject to prior task experience and shaped by statistical learning processes. Humans are active learners. That is, the engagement of the own body in a timing task within a perceptual action loop will make a noticeable difference in timing performance as compared to when humans only passively perceive the same perceptual scenario. Bao et al. 2015. Chen Vroomen 2013. This Research Topic of Sub and Supra Second Timing: Brain, Learning and Development has integrated sixteen submissions of novel research on sub and supra timing. We have categorized the papers in this topic into the following four themes from which we can deduce trends of research about multisensory timing in the sub and supra second range: Sensory timing, interaction and reliability; Adaptive representation of time; Learning and temporal prediction; Sensorimotor synchronization, embodiment and coordination; Perspective of psychological moment and temporal organization.

Overall the collections in Sub and Supra Second Timing Brain Learning and Development show some recent trends and debates in multisensory timing research as well as provide a venue to inspire future work in multisensory timing

Pi: A Source Book Jonathan M. Borwein, 2013-06-29 Our intention in this collection is to provide largely through original writings an extended account of pi from the dawn of mathematical time to the present The story of pi reflects the most seminal the most serious and sometimes the most whimsical aspects of mathematics A surprising amount of the most important mathematics and a significant number of the most important mathematicians have contributed to its unfolding directly or otherwise Pi is one of the few mathematical concepts whose mention evokes a response of recognition and interest in those not concerned professionally with the subject It has been a part of human culture and the educated imagination for more than twenty five hundred years The computation of pi is virtually the only topic from the most ancient stratum of mathematics that is still of serious interest to modern mathematical research To pursue this topic as it developed throughout the millennia is to follow a thread through the history of mathematics that winds through geometry analysis and special functions numerical analysis algebra and number theory It offers a subject that provides mathematicians with examples of many current mathematical techniques as well as a palpable sense of their historical development Why a Source Book Few books serve wider potential audiences than does a source book To our knowledge there is at present no easy access to the bulk of the material we have collected
