Most infections affect the bladder and urethra which are parts of the lower urinary system Compared to men women are more likely to get a UTI An infection that only affects the bladder can be uncomfortable and painful A UTI however can spread to the kidneys and cause major health issues The most common cause of UTIs is when bacteria enter the urinary tract via the urethra and start to proliferate in the bladder It is the purpose of the urinary system to keep bacteria out But sometimes the defences fall apart If that occurs germs may establish a foothold and develop into a serious infection in the urinary system The bladder and urethra are the most commonly affected areas by UTIs which mostly affect women When bacteria or other microorganisms get past the body's defences in the urinary system urinary tract infections UTIs result Although they can create discomfort and urinary issues medicine and natural therapies can frequently make them go away Furthermore obstructions and issues with kidney function can raise someone's likelihood of getting a challenging UTI Overall ladies are more likely than males to get a UTI with 10% of females getting one per year and 40-60% of females getting an infection at least once in their lifetime Because their urethras are shorter than those of men females are more vulnerable because bacteria can enter the bladder more easily Guys and females share similar side effects Notwithstanding 2021 examination proposes that guys had a higher possibility encountering side effects that influence the lower urinary tract

What I Need to Know about Urinary Tract Infections U. S. Department of Health and Human Services, National Institutes

of Health, National Institute of Kidney Diseases, 2012-07-25 A UTI is an infection in the urinary tract. Infections are caused by microbes, organisms too small to be seen without a microscope. Bacteria are the most common cause of UTIs. Normally, bacteria that enter the urinary tract are quickly removed by the body before they cause symptoms. But sometimes bacteria overcome the body's natural defenses and cause infection. The urinary tract is the body's drainage system for removing wastes and extra water. The urinary tract includes two kidneys, two ureters, a bladder, and a urethra. The kidneys are a pair of bean-shaped organs, each about the size of a fist. They are located below the ribs, one on each side of the spine, toward the middle of the back. Every minute, your kidneys filter about 3 ounces of blood, removing wastes and extra water. The wastes and extra water make up the 1 to 2 quarts of urine you produce each day. The urine travels from the kidneys down two narrow tubes called the ureters. The urine is then stored in a balloonlike organ called the bladder and emptied through the urethra, a tube at the bottom of the bladder. This publication by the National Institutes of Health, Publication No. 12-4807, provides information on the causes, signs, and symptoms, diagnosis, and treatment of Urinary Tract Infections.
