Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a 12-week training program or a control group. The training program consisted of three sessions per week, each lasting 45 minutes. The control group did not participate in any training. The primary outcome was the change in HRQL, measured using the SF-36 questionnaire. The secondary outcome was the change in physical fitness, measured using a 6-minute walk test. The results showed that the training program had a significant positive effect on HRQL and physical fitness. The HRQL score increased significantly in the training group compared to the control group. The 6-minute walk test score also increased significantly in the training group compared to the control group. The results suggest that a 12-week training program can improve HRQL and physical fitness in sedentary, middle-aged women.
