

2. Observe the exoskeleton of the crayfish. This protective covering made of chitin provided the structure that your own internal skeleton provided. While observing the outer anatomy, you should notice that there are segments of the crayfish. The rigid segment containing the eyes, head, and thorax is called the cephalothorax. The flexible posterior section is called the abdomen. (Figure 1).

3. On the ventral side of the crayfish, you will notice 5 pairs of legs attached to the cephalothorax. The posterior 4 pairs of legs are used for walking. The most anterior pair of appendages are the chelipeds, used for grasping food and defense. On the ventral side of the abdomen, you will see several pairs of smaller appendages called swimmerets, which help the crayfish swim, move water over the gills, and hold the eggs in female crayfish (Figure 2).
4. Observe the first pair of swimmerets (the pair closest to the cephalothorax). Males will have larger, thicker swimmerets. Females will have short, feathery swimmerets (Figure 2).

5. The fan-shaped segments at the posterior end of the abdomen are called uropods. In the center of the uropods is the telson. Uropods are used to help the crayfish swim (Figure 2).

5. Near the anterior end of the crayfish are two pairs of antennae. These antennae help the crayfish detect its surroundings and see in dark, murky water. Gently remove the large chelipeds to better observe the mouth. The largest structures are called the maxillipeds (Figure 3), and they hold the crayfish's food source while it is eating. Located just below the maxillipeds are the mandibles that are used to grind up the food (Figure 4).
