for this relationship it is not necessary that ontogeny recapitulate phylogeny but rather to establish that students can face similar difficulties in conceptualising problems as those faced by the scientists in the past Given the vast amount of literature on students alternative conceptions misconceptions in science it is plausible to suggest that these can be considered not as mistakes but rather as tentative models leading to greater conceptual understanding Just as scientists resist changes in the hard core of their beliefs by offering auxiliary hypotheses students may adopt similar strategies Conceptual change in science education can thus be conceptualised as building of tentative models that provide greater explanatory power to students understanding

Explaining Science In The Classroom Ogborn, Jon, Kress, Gunther, Martins, Isabel, 1996-11-01 This is an impressive book It is an example of that rare item a book about complex scientific ideas expressed in clear simple language built on real teacher learner conversations Starting in the classroom or the laboratory with the most common occurrence a teacher offering an explanation it proceeds by analysing the nature of specific explanations so that teachers can gain fuller insights into what is happening Having teased out the processes of explanation the authors then reconstruct them showing how elaboration transformation and demonstration can enhance the understanding of the learner Professor Peter Mortimore How do science teachers explain science to students

What makes explanations work Is explaining science just an art or can it be described taught and learned That is the question posed by this book From extensive classroom observations the authors give vivid descriptions of how teachers explain science to students and provide their account with a sound theoretical basis Attention is given to the ways in which needs for explanation are generated how the strange new entities of science from genes to electrons are created through talk and action how knowledge is transformed to become explainable and how demonstrations link explanation and reality Different styles of explanation are illustrated from the teller of tales to those who ask students to say it my way Explaining Science in the Classroom is a new and exciting departure in science education It brings together science educators and specialists in discourse and communication to reach a new synthesis of ideas The book offers science teachers very practical help and insight

Taber, 2019-12-05 Chemistry is a subject that has the power to engage and enthuse students but also to mystify and confound them Effective chemistry teaching requires a strong foundation of subject knowledge and the ability to transform this into teachable content which is meaningful for students Drawing on pedagogical principles and research into the difficulties that many students have when studying chemical concepts this essential text presents the core ideas of chemistry to support new and trainee chemistry teachers including non specialists The book focuses on the foundational ideas that are fundamental to and link topics across the discipline of chemistry and considers how these often complex notions can be effectively presented to students without compromising on scientific authenticity Chapters cover the nature of chemistry as a science the chemistry triplet substances and purity in chemistry the periodic table energy in chemistry and chemical bonding contextualising and integrating chemical knowledge Whilst there are a good many books describing chemistry and many others that offer general pedagogic guidance on teaching science Foundations for Teaching Chemistry provides accounts of core chemical topics from a teaching perspective and offers new and experienced teachers support in developing their own chemical knowledge for teaching

Metaphor and Analogy in Science Education Peter J. Aubusson, Allan G. Harrison, Stephen M. Ritchie, 2006-06-28 Years ago a primary teacher told me about a great series of lessons she had just had The class had visited rock pools on the seashore and when she asked them about their observations they talked about it was like a factory it was like a church it was like a garden it was like our kitchen at breakfast time etc Each student s analogy could be elaborated and these analogies provided her with strongly engaged students and a great platform from which to develop their learning about biological diversity and interdependence In everyday life we learn so many things by comparing and contrasting The use of analogies and metaphors is important in science itself and their use in teaching science seems a natural extension but textbooks with their own sparse logic do not help teachers or students David Ausubel in the 1960s had advocated the use of advance organisers to introduce the teaching of conceptual material in the sciences and some of these had an analogical character However research on the value of this idea was cumbersome and indecisive and it ceased after just a few studies In the 1980s research into children s
