Heat Transfer Modeling George Sidebotham, 2015-02-13 This innovative text emphasizes a less is more approach to modeling complicated systems such as heat transfer by treating them first as 1 node lumped models that yield simple closed form solutions The author develops numerical techniques for students to obtain more detail but also trains them to use the techniques only when simpler approaches fail Covering all essential methods offered in traditional texts but with a different order Professor Sidebotham stresses inductive thinking and problem solving as well as a constructive understanding of modern computer based practice Readers learn to develop their own code in the context of the material rather than just how to use packaged software offering a deeper intrinsic grasp behind models of heat transfer Developed from over twenty five years of lecture notes to teach students of mechanical and chemical engineering at The Cooper Union for the Advancement of Science and Art the book is ideal for students and practitioners across engineering disciplines seeking a solid understanding of heat transfer This book also Adopts a novel inductive pedagogy where commonly understood examples are introduced early and theory is developed to explain and predict readily recognized phenomena Introduces new techniques as needed to address specific problems in contrast to traditional texts use of a deductive approach where abstract general principles lead to specific examples Elucidates readers understanding of the heat transfer takes time idea transient analysis applications are introduced first and steady state methods are shown to be a limiting case of those applications Focuses on basic numerical methods rather than analytical methods of solving partial differential equations largely obsolete in light of modern computer power Maximizes readers insights to heat transfer modeling by framing theory as an engineering design tool not as a pure science as has been done in traditional textbooks Integrates practical use of spreadsheets for calculations and provides many tips for their use throughout the text examples

System Performance: Maximizing Energy Efficiency in Heating and Cooling Randy F. Petit, Sr., Turner L. Collins, Earl Delatte, Erik Rasmussen, 2014-07-01 Heating Ventilation Air Conditioning HVAC equipment is only as good as the installation Studies show that the majority of HVACR equipment is not installed to manufacturer specifications costing the consumer more money 68% of all air conditioning systems are improperly charged 70% of all systems have improper airflow 91% of systems remain untested for combustion safety and efficiency The System Performance training manual is broken into four

sections Each section covers the techniques and procedures required for a technician to maximize the energy efficiency of HVAC systems 1 Airflow Covers the properties of air airflow measuring tools CFM calculations requirements blower performance and sensible heat ratios 2 Critical Charging Reviews the three charging methods by weight system superheat and condenser subcooling It gives examples of calculating the total charge based on line sizes and provides an easy method to check whether a system is operating to rated capacity 3 Psychrometrics Covers the parts of a psychrometric chart and calculating the thermodynamic properties of air Also this section demonstrates using wet and dry bulb temperatures to plot air conditions being heated or cooled which enables the technician to obtain a systems effect on sensible and latent building load 4 Combustion Analysis This section reviews the basic combustion process and the factors that affect heating efficiency Proper methods for furnace setting of airflow adjustment and testing fuel pressure and flue gas venting
