Crustacean Reproductive Physiology and its Applications Haihui Ye, Chaoshu Zeng, Naoaki Tsutsui, Heinrich Dirksen, 2022-09-27 Demand for crustacean production is increasing significantly throughout the world and crustacean production from capture fisheries has almost stagnated Aquaculture is the only possibility to meet this ever growing demand for crustaceans Still many commercially important crustaceans are being captured from the wild while breeding and seed production technologies are not available for these species The bottleneck in the successful breeding of crustacean species is mainly due to the non availability of information about reproductive biology Studies on crustacean reproduction will shed new light on understanding the mechanism of sex determination and differentiation meanwhile the application of innovative techniques will vitally contribute to the progress of the crustacean industry The research findings on crustacean reproduction will directly benefit aquaculture for successful captive breeding and seed production Here we are gathering both original research and review papers with the scope of the research topic including but not limited to Mechanism of sex determination sexual differentiation and gonadal development in crustaceans Other life functions e g endocrine nutrition immunity heredity involved in reproduction in crustaceans Applications of modern endocrinological and molecular

pathogenesis and multi-drug resistance mechanisms Shicheng Chen,Lisheng Liao,Mingxi Wang,2025-04-17 The World Health Organization WHO has identified antimicrobial resistance AMR as one of the most critical global public health threats At least 4 95 million people death was caused by AMR in 2019 Even worse its potential economic impact is estimated to reach a staggering 100 trillion due to AMR in the next thirty years <https://www.who.int/health-topics/antimicrobial-resistance> Researching the development of antibiotic resistance and exploring ways to prevent detect and treat antimicrobial resistant infections have been prioritized in the medical microbiology field AMR mechanisms have been uncovered on many Enterobacteriaceae and Gram positive bacteria such as Enterococcus faecium and Staphylococcus aureus due to their clinical significance and diverse resistance mechanisms Unfortunately the opportunistic pathogens have been overlooked in the clinics because they are often identified as normal flora or common environmental organisms in human specimens Opportunistic pathogens may have low pathogenicity while they can often cause serious infections in immunocompromised patients and lead to outbreak in the healthcare settings They may even lead to diseases in healthy individuals if being introduced into hosts system by traumatization Management of such infections is often challenging due to the lack of guidelines standards for antibiotic susceptibility tests as well as multi drug resistance MDR Lately diseases linked to non pathogenic microorganisms are becoming more common under typical conditions such as Stenotrophomonas maltophilia Elizabethkingia spp Acinetobacter baumannii and many others **Cardiovascular Fibrosis and Related Diseases: Basic**

prooxidant products of metabolic processes and the antioxidant molecules within the cells. The imbalance often led to the underlying factors that exacerbate the pathogenesis of some life threatening diseases such as carcinogenesis, obesity, diabetes and cardiovascular diseases. Natural products including phytochemicals and functional foods are known for their ability to affect metabolic processes such as ameliorating reactive oxygen species induced mitochondria dysfunction, mitigating inflammatory response and other cellular functions that could ameliorate the disease developments. Despite the relatively low toxicities of natural products as compared with synthetic products, further studies are still required to optimize the bioavailability. Therapeutics, pharmaceuticals and clinical trials of natural products in patients suffering oxidative and metabolic diseases.

Ontogeny and Phylogeny of Brain Barrier Mechanisms Norman R Saunders, Helen B Stolp, Shane A Liddelow, 2016-04-15

The brain functions within an internal environment that is determined and controlled by morphological structures and cellular mechanisms present at interfaces between the brain and the rest of the body. In vertebrates, these interfaces are across cerebral blood vessels, blood-brain barrier, choroid plexuses, blood-cerebrospinal fluid barrier and pia-arachnoid. There is a CSF-brain barrier in the neuroepithelium lining the ventricular system that is only present in embryos. There is now substantial evidence that many brain barrier mechanisms develop early and that in some cases they are functionally more active and even more specialized compared to adult barriers. Therefore, barriers in developing brain should be viewed as adapted appropriately for the growing brain and not as is still widely believed immature. Considerable advances in our understanding of these barrier mechanisms have come from studies of the developing brain and invertebrates. A striking aspect to be highlighted in this special edition is that many of the molecular mechanisms in these very diverse species are similar despite differences in the cellular composition of the interfaces. This Frontiers Topic comprises articles in three sections: Original studies, Reviews and Myths/Misconceptions. Original articles provide new information on molecular and cellular barrier mechanisms in developing brains of primates including human embryos (Brchner et al, Ek et al, Errede et al), rodents (Bauer et al, Liddelow, Strazielle, Gherzi, Egea, Saunders et al, Whish et al, chick (Bueno et al) and zebrafish (Henson et al) as well as studies in *Drosophila* (Hindle, Bainton, De Salvo et al, Limmer et al). The Reviews section includes evolutionary perspectives of the blood-brain and blood-CSF barriers (Bueno et al, Bill Kozh). There are also detailed reviews of the current state of understanding of different interfaces and their functional mechanisms in developing brain (Bauer et al, Strazielle, Gherzi, Egea, Liddelow, Richardson et al, Errede et al, Henson et al, Brchner et al) and in invertebrates (Hindle, Bainton, De Salvo et al, Limmer et al). Different aspects of the relationship between properties of the

internal environment of the brain and its development are discussed Stolp Molnar Johansson Prasongchean et al A neglected area namely barriers over the surface of the brain during development is also covered Br chner et al Clinically related perspectives on barrier disruption in neonatal stroke are provided by Kratzer et al and other aspects of dysfunction by Morretti et al and by Palmeta et al on the continuing problem of bilirubin toxicity Progress in this field is hampered by many prevailing myths about barrier function combined with methodologies that are not always appropriately selected or interpreted These is covered in the Misconceptions Myths and Methods section including historical aspects and discussion of the paracellular pathway a central dogma of epithelial and endothelial biology Saunders et al and a review of markers used to define brain barrier integrity in development and in pathological conditions Saunders et al Use of inappropriate markers has caused considerable confusion and unreliable interpretation in many published studies Torbett et al deal with the complexities of the new field of applying proteomics to understanding blood brain barrier properties as do Huntley at al with respect to applying modern high throughput gene expression methods Huntley et al The Editorial summarizes the contributions from all authors This includes mention of some the main unanswered but answerable questions in the field and what the impediments to progress may be

Autonomic Nervous System and Sleep

Sudhansu Chokroverty, Pietro Cortelli, 2021-02-23 This comprehensive book addresses all elements of the autonomic nervous system ANS and sleep interaction as well as ANS alterations in sleep and how these impact primary and comorbid sleep dysfunction It meets the market need for a comprehensive text that deals with ANS changes in sleep and how these impact various neurological medical and primary sleep disorders Organized into three parts the book begins with a review of the foundational bodily systems that participate in coordination of ANS activity with other homeostatic responses such as respiration cardiovascular reflexes and responses to stress Part two then examines methods of laboratory evaluation and the

why when how of interpreting heart rate variability in sleep To conclude the final section of the book broadly covers the many clinical aspects of ANS including insomnia restless leg syndrome sleep apnea sleep related epilepsy and acute autonomic neuropathy Autonomic Nervous System and Sleep enhances the reader s understanding of the pathophysiology of various disorders and explains how to apply this profound understanding is important to new lines of therapy to improve morbidity

Astrocytes in (Patho)Physiology of the Nervous System Vladimir Parpura,Philip G. Haydon,2008-12-11

Astrocytes were the original neuroglia that Ramon y Cajal visualized in 1913 using a gold sublimate stain This stain targeted intermediate filaments that we now know consist mainly of glial fibrillary acidic protein a protein used today as an astrocytic marker Cajal described the morphological diversity of these cells with some astrocytes surrounding neurons while the others are intimately associated with vasculature We start the book by discussing the heterogeneity of astrocytes using contemporary tools and by calling into question the assumption by classical neuroscience that neurons and glia are derived from distinct pools of progenitor cells Astrocytes have long been neglected as active participants in intercellular communication and information processing in the central nervous system in part due to their lack of electrical excitability The follow up chapters review the nuts and bolts of astrocytic physiology astrocytes possess a diverse assortment of ion channels neurotransmitter receptors and transport mechanisms that enable the astrocytes to respond to many of the same signals that act on neurons Since astrocytes can detect chemical transmitters that are released from neurons and can release their own extracellular signals there is an increasing awareness that they play physiological roles in regulating neuronal activity and synaptic transmission In addition to these physiological roles it is becoming increasingly recognized that astrocytes play critical roles during pathophysiological states of the nervous system these states include gliomas Alzheimer disease and epilepsy to mention a few
