CAD/CAM Robotics and Factories of the Future Birendra Prasad, 2012-12-06 This volume is about automation automation in design automation in manufacturing and automation in production Automation is essential for increased productivity of quality products at reduced costs That even partial or piecemeal automation of a production facility can deliver dramatic improvements in productivity has been amply demonstrated in many a real life situation Hence currently

great efforts are being devoted to research and development of general as well special methodologies and tools for automation This volume reports on some of these methodologies and tools In general terms methodologies for automation can be divided into two groups There are situations where a process whether open loop or closed loop is fairly clearly understood In such a situation it is possible to create a mathematical model and to prescribe a mathematical procedure to optimize the output If such mathematical models and procedures are computationally tractable we call the corresponding automation algorithmic or parametric programming There is however a second set of situations which include processes that are not well understood and the available mathematical models are only approximate and discrete While there are others for which mathematical procedures are so complex and disjoint that they are computationally intractable These are the situations for which heuristics are quite suitable for automation We choose to call such automation knowledge based automation or heuristic programming
