Grating-Based X-Ray Phase-Contrast Mammography Kai Hermann Scherer, 2016-06-06 This thesis offers an accessible guide to biomedical phase contrast imaging with over 20 radiographic illustrations It focuses on research to improve radiography and particularly mammography applications by using a novel X ray imaging modality that exploits the wave nature of X rays rather than just their absorption in tissue Further it explores a broad range of potential applications from the assessment of breast cancer and the evaluation of microcalcification clusters to the examination of renal stones X ray imaging is an indispensable tool in modern medical diagnostics and ranges from simple radiography applications to advanced CT imaging protocols This novel phase contrast approach has the potential to

deliver significantly improved diagnostic information also and especially in cases where mammography is used for screening purposes The thesis is based on several studies conducted by the author working in close interdisciplinary cooperation with medical doctors at two university clinics in Munich and successfully demonstrates this diagnostic potential in pre clinical experiments
