R. Bourne, W. Regenass, W. Richarz, 2017-05-04 ISCRE 10 Tenth

International Symposium on Chemical Reaction Engineering documents the proceedings of the symposium which brought together experts from all over the world to discuss developments in CRE Efforts were made to cover high added value substances and to encourage papers from industry Some success was achieved but there remain significant gaps between Chemists and Chemical Engineers when considering high added value products as well as between researchers and practitioners of CRE The volume begins with plenary papers covering topics such as challenges in reactor modeling bioreactor engineering the design of reaction systems for specialty organic chemicals. This is followed by papers presented during the eight technical sessions Technical session A focused on the modeling and control of chemical reactions Technical session B was devoted to studies on biotechnology Technical session C covered mixing while Technical session D dealt with special reactor systems and chemicals The papers in Technical session E examined reactions for emission control and recycling Technical session F covered the safety aspects of CRE Technical session G focused on the experiments with multiphase reactions while Technical session H dealt with catalytic reactors Chemical Reaction Engineering Octave Levenspiel, 1972-07-14 An improved and simplified edition of this classic introduction to the principles of reactor design for chemical reactions of all types homogeneous catalytic biochemical gas solid extractive etc Adds new material on systems of deactivating catalysts flow modeling and diagnosis of the ills of operating equipment and new simple design procedures for Introduction to Chemical Reactor Analysis R.E. Hayes, 2020-12-17 This book packed bed and fluidized bed reactors provides an introduction to the basic concepts of chemical reactor analysis and design It is intended for both the senior level undergraduate student in chemical engineering and the working professional who may require an understanding of the basics of this subject Mathematical Modeling for Flow and Transport Through Porous Media Gedeon Dagan, Ulrich Hornung, Peter Knabner, 2013-06-29 The main aim of this paper is to present some new and general results applicable to the the equations of two phase flow as formulated in geothermal reservoir engineering Two phase regions are important in many geothermal reservoirs especially at depths of order several hundred metres where ris ing essentially isothermal single phase liquid first begins to boil The fluid then continues to rise with its temperature and pressure closely following the saturation boiling curve appropriate to the fluid composition Perhaps the two most interesting theoretical aspects of the idealised two phase flow equations in geothermal reservoir engineering are that firstly only one component water is involved and secondly that the densities of the two phases are so different This has led to the approximation of ignoring capillary pressure The main aim of this paper is to analyse some of the consequences of this assumption especially in relation to saturation changes within a uniform porous medium A general analytic treatment of three dimensional flow is considered Pre viously three dimensional modelling in geothermal reservoirs have relied on numerical simulators In contrast most of the past analytic work has been restricted to one dimensional examples
