Modern Applications of Automata Theory Deepak D'Souza, Priti Shankar, 2012 Automata theory has come into prominence in recent years with a plethora of applications in fields ranging from verification to XML processing and file compression In fact the 2007 Turing Award was awarded to Clarke Emerson and Sifakis for their pioneering work on model checking techniques To the best of our knowledge there is no single book that covers the vast range of applications of automata theory targeted at a mature student audience This book is intended to fill that gap and can be used as an intermediate level textbook It begins with a detailed

treatment of foundational material not normally covered in a beginner's course in automata theory and then rapidly moves on to applications. The book is largely devoted to verification and model checking and contains material that is at the cutting edge of verification technology. It will be an invaluable reference for software practitioners working in this area.

Neuromimetic Semantics Harry Howard, 2010-08-10. This book attempts to marry truth conditional semantics with cognitive linguistics in the church of computational neuroscience. To this end it examines the truth conditional meanings of coordinators, quantifiers and collective predicates as neurophysiological phenomena that are amenable to a neurocomputational analysis. Drawing inspiration from work on visual processing and especially the simple complex cell distinction in early vision V1, we claim that a similar two layer architecture is sufficient to learn the truth conditional meanings of the logical coordinators and logical quantifiers. As a prerequisite, much discussion is given over to what a neurologically plausible representation of the meanings of these items would look like. We eventually settle on a representation in terms of correlation so that for instance the semantic input to the universal operators *e.g.* *and* and *all* is represented as maximally correlated while the semantic input to the universal negative operators *e.g.* *nor* and *no* is represented as maximally anticorrelated. On the basis of this representation the hypothesis can be offered that the function of the logical operators is to extract an invariant feature from natural situations: that of degree of correlation between parts of the situation. This result sets up an elegant formal analogy to recent models of visual processing which argue that the function of early vision is to reduce the redundancy inherent in natural images. Computational simulations are designed in which the logical operators are learned by associating their phonological form with some degree of correlation in the inputs so that the overall function of the system is as a simple kind of pattern recognition. Several learning rules are assayed, especially those of the Hebbian sort which are the ones with the most neurological support. Learning vector quantization (LVQ) is shown to be a perspicuous and efficient means of learning the patterns that are of interest. We draw a formal parallelism between the initial competitive layer of LVQ and the simple cell layer in V1 and between the final linear layer of LVQ and the complex cell layer in V1 in that the initial layers are both selective while the final layers both generalize. It is also shown how the representations argued for can be used to draw the traditionally recognized inferences arising from coordination and quantification and why the inference of subalternacy breaks down for collective predicates. Finally, the analogies between early vision and the logical operators allow us to advance the claim of cognitive linguistics that language is not processed by proprietary algorithms but rather by algorithms that are general to the entire brain. Thus, in the debate between objectivist and experiential metaphysics, this book falls squarely into the camp of the latter. Yet it does so by means of a rigorous formal mathematical and neurological exposition in contradiction of the experiential claim that formal analysis has no place in the understanding of cognition. To make our own counter claim as explicit as possible, we present a sketch of the LVQ structure in terms of mereotopology in which the initial layer of the network performs topological operations while the final layer

performs mereological operations The book is meant to be self contained in the sense that it does not assume any prior knowledge of any of the many areas that are touched upon It therefore contains mini summaries of biological visual processing especially the retinocortical and ventral what parvocellular pathways computational models of neural signaling and in particular the reduction of the Hodgkin Huxley equations to the connectionist and integrate and fire neurons Hebbian learning rules and the elaboration of learning vector quantization the linguistic pathway in the left hemisphere memory and the hippocampus truth conditional vs image schematic semantics objectivist vs Language and Automata Theory and Applications Carlos Martín-Vide,Alexander Okhotin,Dana Shapira,2019-03-12 This book constitutes the refereed proceedings of the 13th International Conference on Language and Automata Theory and Applications LATA 2019 held in St Petersburg Russia in March 2019 The 31 revised full papers presented together with 5 invited talks were carefully reviewed and selected from 98 submissions The papers cover the following topics Automata Complexity Grammars Languages Graphs trees and rewriting and Words and codes
