Peters, Thomas E. Lovejoy, 1992-01-01 The biological effects of global warming should be of concern to all thinking individuals for warming could cause profound disruption of natural ecosystems and could threaten many species with extinction This important book the first to discuss in detail the consequences of global warming for ecosystems includes commentary by distinguished scientists on many aspects of this critical problem Experts describe responses of animals and plants to previous climate changes interactions between various environmental components precipitation and soil chemistry for example and synergisms between climate change and human activities such as deforestation They consider many specific ecosystems including tropical forests the deciduous forests of eastern North America the forests of the Pacific Northwest Mediterranean type ecosystems in California arctic tundra and arctic marine systems Offering discussions that are both factual and speculative the volume points the way to future investigations of the implications of global warming Science Abstracts, 1953 *Resources in Education*, 1988-10 Advances in Ecological Research, 1992-03-25 The concepts and

concerns regarding the global effects of a continued increase in the atmospheric concentrations of greenhouse gases have enjoyed a high visibility in newspapers and scientific journals. This concern is now being translated into big science projects. These international projects aim to understand better the processes of climate and ecosystem changes and impacts and are being designed under the aegis of the World Climate Research Programme and the International Geosphere Biosphere Programme. Biological and climatic systems are intertwined in processes leading to impacts and feedbacks and so it has emerged that climatologists, atmospheric scientists, terrestrial and marine ecologists must collaborate in research programmes else the bases of their future projections are incomplete. This special volume of *Advances in Ecological Research* brings together eight papers which propose and demonstrate the two major components of current climate change research: future prediction and interdisciplinary approach.
