Functional Plant Ecology Francisco Pugnaire, Fernando Valladares, 2007-06-20 Following in the footsteps of the successful first edition, *Functional Plant Ecology* Second Edition remains the most authoritative resource in this

multidisciplinary field Extensively revised and updated this book investigates plant structure and behavior across the ecological spectrum It features the ecology and evolution of plant crowns and a **Ecological and Economic Entomology** Brian E. Freeman, 2020-11-11 Ecological and Economic Entomology is a comprehensive advanced text covering all aspects of the role of insects in natural ecosystems and their impacts on human activity The book is divided into two sections The first section begins with an outline of the structure classification and importance of insects followed by the geographical aspects of plant distribution and the complex defences plants marshal against herbivorous insects Insect pests affecting plant roots stem leaf and reproductive systems are covered in a comprehensive review This section also covers insects that are important in medical and veterinary science paying particular attention to those that transmit pathogens The section concludes with the beneficial aspects of insects especially their use in biological control but also as soil formers and their importance in forensic science **Resolving Ecosystem Complexity** Oswald J. Schmitz, 2010-07-01 An ecosystem's complexity develops from the vast numbers of species interacting in ecological communities The nature of these interactions in turn depends on environmental context How do these components together influence an ecosystem's behavior as a whole Can ecologists resolve an ecosystem's complexity in order to predict its response to disturbances Resolving Ecosystem Complexity develops a framework for anticipating the ways environmental context determines the functioning of ecosystems Oswald Schmitz addresses the critical questions of contemporary ecology How should an ecosystem be conceptualized to blend its biotic and biophysical components How should evolutionary ecological principles be used to derive an operational understanding of complex adaptive ecosystems How should the relationship between the functional biotic diversity of ecosystems and their properties be understood Schmitz begins with the universal concept that ecosystems are comprised of species that consume resources and which are then resources for other consumers From this he deduces a fundamental rule or evolutionary ecological mechanism for explaining context dependency individuals within a species trade off foraging gains against the risk of being consumed by predators Through empirical examples Schmitz illustrates how species use evolutionary ecological strategies to negotiate a predator eat predator world and he suggests that the implications of species trade offs are critical to making ecology a predictive science Bridging the traditional divides between individuals populations and communities in ecology Resolving Ecosystem Complexity builds a systematic foundation for thinking about natural systems **Concepts and Controversies in Tidal Marsh Ecology** M.P. Weinstein, Daniel A. Kreeger, 2007-05-08 In 1968 when I forsook horticulture and plant physiology to try with the help of Sea Grant funds wetland ecology it didn't take long to discover a slim volume published in 1959 by the University of Georgia and edited by R A Ragotzkie L R Pomeroy J M Teal and D C Scott entitled Proceedings of the Salt Marsh Conference held in 1958 at the Marine Institute Sapelo Island Ga Now forty years later the Sapelo Island conference has been the major intellectual impetus and another Sea Grant Program the major backer of another symposium the International Symposium Concepts and Controversies in Tidal Marsh Ecology This one re

examines the ideas of that first conference ideas that stimulated four decades of research and led to major legislation in the United States to conserve coastal wetlands It is dedicated appropriately to two then young scientists Eugene P Odum and John M Teal whose inspiration has been the starting place for a generation of coastal wetland and estuarine research I do not mean to suggest that wetland research started at Sapelo Island In 1899 H C Cowles described successional processes in Lake Michigan freshwater marsh ponds There is a large and valuable early literature about northern bogs most of it from Europe and the former USSR although Eville Gorham and R L Lindeman made significant contributions to the American literature before 1960 V J

widely used as a textbook and this Second Edition should continue to serve students in advanced classes The Second Edition features expanded and updated chapters especially with respect to the cited references and the classification of North American freshwater invertebrates New chapters or substantially revised chapters include those on freshwater ecosystems snails aquatic spiders aquatic insects and crustaceans Most up to date and informative text of its kind Written by experts in the ecology of various invertebrate groups coverage emphasizes ecological information within a current taxonomic framework Each chapter contains both morphological and taxonomic information including keys to North American taxa usually to the generic level as well as bibliographic information and a list of further readings The text is geared toward researchers and advanced undergraduate and graduate students

Metacommunity Ecology Mathew A. Leibold, Jonathan M. Chase, 2018 Metacommunity ecology links smaller scale processes that have been the provenance of population and community ecology such as birth death processes species interactions selection and stochasticity with larger scale issues such as dispersal and habitat heterogeneity Until now the field has focused on evaluating the relative importance of distinct processes with niche based environmental sorting on one side and neutral based ecological drift and dispersal limitation on the other This book moves beyond these artificial categorizations showing how environmental sorting dispersal ecological drift and other processes influence metacommunity structure simultaneously Mathew Leibold and Jonathan Chase argue that the relative importance of these processes depends on the characteristics of the organisms the strengths and types of their interactions the degree of habitat heterogeneity the rates of dispersal and the scale at which the system is observed Using this synthetic perspective they explore metacommunity patterns in time and space including patterns of coexistence distribution and diversity Leibold and Chase demonstrate how these processes and patterns are altered by micro and macroevolution traits and phylogenetic relationships and food web interactions They then use this scale explicit perspective to illustrate how metacommunity processes are essential for understanding macroecological and biogeographical patterns as well as ecosystem level processes Moving seamlessly across scales and subdisciplines *Metacommunity Ecology* is an invaluable reference one that offers a more integrated approach to ecological patterns and processes
