**Handbook on Agent-Oriented Design Processes** Massimo Cossentino, Vincent Hilaire, Ambra Molesini, Valeria Seidita, 2014-03-28 To deal with the flexible architectures and evolving functionalities of complex modern systems the agent metaphor and agent based computing are often the most appropriate software design approach As a result a broad range of special purpose design processes has been developed in the last several years to tackle the challenges of these specific application domains In this context in early 2012

the IEEE FIPA Design Process Documentation Template SC0097B was defined which facilitates the representation of design processes and method fragments through the use of standardized templates thus supporting the creation of easily sharable repositories and facilitating the composition of new design processes Following this standardization approach this book gathers the documentations of some of the best known agent oriented design processes After an introductory section describing the goal of the book and the existing IEEE FIPA standard for design process documentation thirteen processes including the widely known Open UP the de facto standard in object oriented software engineering are documented by their original creators or other well known scientists working in the field As a result this is the first work to adopt a standard unified descriptive approach for documenting different processes making it much easier to study the individual processes to rigorously compare them and to apply them in industrial projects While there are a few books on the market describing the individual agent oriented design processes none of them presents all the processes let alone in the same format With this handbook for the first time researchers as well as professional software developers looking for an overview as well as for detailed and standardized descriptions of design processes will find a comprehensive presentation of the most important agent oriented design processes which will be an invaluable resource when developing solutions in various application areas

*Interorganizational Workflow Management* Karin Pargfrieder, 2002-05-30 Inhaltsangabe Abstract Conventional workflow management focuses on improving the efficiency of business processes within one organization However processes should not only be supported within the enterprise but also when crossing organizational boundaries e g in order to support new forms of collaborations as virtual enterprises Due to the different nature of interorganizational workflows conventional workflow technology cannot be directly applied The most important requirement specific to interorganizational workflow systems is obviously that they are able to deal with heterogeneity and that it is not too expensive to achieve interoperability Also maintaining the privacy of internal processes is a major concern and security issues should be addressed This diploma thesis gives an introduction to conventional and interorganizational workflow management their aspects and concepts It elaborates the requirements relevant for interorganizational workflow systems describes the most important approaches projects and initiatives that currently exist in the area of interorganizational workflows including XML based approaches the standards of the WfMC electronic marketplaces and electronic contracting An evaluation of these approaches based on criteria derived from the requirements and other characteristics shows the differing strengths and weaknesses The XML based approaches provide standards for the process interfaces and can cope with heterogeneous environments very well Some of them even allow spontaneous commerce with new trading partners without custom integration Traditional EDI is in principle similar but has many disadvantages The standards of the WfMC enable integration with a very low effort if they are followed by software providers But privacy and security are potential problem areas and the models of interoperability that realistically can be supported are simple Electronic marketplaces and electronic contracting are ideal if a high number of

business partners has to be supported and the services are chosen dynamically depending on the situation But these services have to be comparable with rather simple interfaces
