

Torque - ing Wheel nuts/studs

Why do we need to TORQUE the wheels?

- Torqued wheel nuts/bolts are intended to stretch slightly when correctly tightened within specifications. In the case of wheel studs and nuts or wheel bolts, this provides the correct pre-load required for the wheel and the hub to be safely locked and secured.
- If the wheel nuts/bolts are insufficiently tightened, the nuts/bolts could come loose, causing safety and vehicle damage.
- If the wheel nuts/bolts are over tightened, the wheel stud or bolt can be permanently stretched where it will be subjected to the wheel rings, or even break during tightening.
- The only way to ensure the correct torque settings is with the use of a quality and properly calibrated, or an air torque wrench used in taking the time to tighten the wheel nuts/bolts correctly.
- Never use an air impact wrench to tighten wheel nuts/bolts. You will not be able to accurately control the torque, and an impact that is overly damaged the wheel nuts/bolts under the tire and surface area. When working with steel wheels in particular, with damage, even if temporary, is simply not acceptable.

CAUTION:

- **Do not over-tighten WHEEL NUTS/BOLTS to the point:**
- **Do not lubricate the fasteners**
- **Always use nuts/bolts that fit the wheel and the hub or studs properly**
- When fitting the wheels, don't make the mistake of finger tightening the wheel nuts/bolts and then leaving the vehicle to the ground to finish tightening. It is best to perform your complete fitting procedure while the vehicle is supported off the ground. If the wheel's hub surfaces are not properly seated, the weight of the vehicle will result in uneven deformation (due to vehicle weight), which will result in wrong torque settings and wheel damage.
- In order to prevent the wheel from coming away the hub before an air wheel is fitted, use at a 45° angle from an axle nut plate on the hub where the wheel and nuts/bolts were removed at correct deflation.
- Never use any form of lubricant grease or oil on the threads of the wheel bolts or wheel nuts. Lubrication will have a negative effect on the torque applied to the fasteners leading to incorrect torque of the components.
- The torque guidelines are given in different units (Nm, etc.).

How to torque the wheel nuts/bolts correctly

- When possible always refer to the vehicle manufacturer's recommended torque settings.
- First tightening the wheel nuts/bolts using a calibrated, professional torque wrench correctly adjusted to the required torque settings at a pre-set torque amount of the correct value.
- Always use a correct sequence (see diagram) below.
- Do not over-torque a wheel nut/bolt as it can strip the threads, stretch or break the wheel nuts/bolts, and cause distortion of the wheel, brake noise, cracks/breaks etc.
- After fitting wheels it is advisable to re-torque the wheel nuts/bolts again after the first drive off. Inspection of driving to ensure that any compression of the wheel material is compensated for and torque levels are maintained at the safe specifications, especially with new alloy wheels.

What are the various fastener seat styles?

- The "seat" is the contact area between the fastener's head and the wheel.
- The seat style of the fastener must match that of the wheel.
- If the seat style is wrong, the wheel will not be properly fastened to the hub and will damage the wheel.
- The wheel will eventually become worn and visible as it moves in relation to the hub.
- Any play between the wheel and the nuts/bolts will damage the wheels, which could lead to loss of the structural integrity.
- Seat styles that describe the shape of the area where the fastener meets the hole in the wheel include:
 - **Flat**
 - **Conical**
 - **Flat (ring)**
