synthesis of commodity chemicals of global importance and in catalytic systems that possess a critical role in energy generation and environmental protection approaches. As a result of the ongoing progress in materials science, nanotechnology and characterizations, great advances have been achieved in heterogeneous catalysis by nanomaterials. Efficient approaches and advanced methods for the design of nanostructured composite materials up to atomic level, subject to specific nano morphologies with enhanced metal-metal and metal-support interactions favorable for catalysis, that enable fine tuning of the critical properties of the designed catalysts, provide optimized catalysts with outstanding performances in numerous eco friendly and cost effective applications. Accordingly, great progress has been achieved involving, for example, emissions control, waste treatment, photocatalytic bio refinery, CO₂ utilization and fuel cells applications, as well as hydrocarbon processing for H₂ added value chemicals and liquid fuels production. The themed Special Issue has succeeded in collecting 10 high quality contributions that cover recent research progress in the field for a variety of applications, e.g., environment, energy, added value chemicals, organics synthesis and bio transformation, declaring the prospect and importance of nanomaterials in all the directions of heterogeneous catalysis.

Inorganic Ion Exchange Materials Abraham Clearfield, 2018-02-01. This book extends the frontiers of the ion exchange technologist and highlights new materials for the future.

Environmental Applications of Nanomaterials Glen E. Fryxell, Guozhong Cao, 2012. This book is concerned with functional nanomaterials, materials containing specific predictable nanostructures whose chemical composition or interfacial structure enables them to perform a specific job to destroy, sequester or detect some material that constitutes an environmental threat. Nanomaterials have a number of features that make them ideally suited for this job: they have a high surface area, high reactivity, easy dispersability and rapid diffusion, to name a few. The purpose of this book is to showcase how these features can be tailored to address some of the environmental remediation and sensing detection problems faced by mankind today. A number of leading researchers have contributed to this volume, painting a picture of diverse synthetic strategies, structures, materials and methods. The intent of this book is to showcase the current state of environmental nanomaterials in such a way as to be useful either as a research resource or as a graduate level textbook. We have organized this book into sections on nanoparticle based remediation strategies, nanostructured inorganic materials, e.g., layered materials like the apatites, nanostructured organic-inorganic hybrid materials and the use of nanomaterials to enhance the performance of sensors.

Nanocomposites for Pollution Control Chaudhery Mustansar Hussain, Ajay Kumar Mishra, 2018-04-24. Nanocomposites present outstanding mechanical properties and compatibility owing to their composite matrix and unique physical and chemical composition provided by large surface area to volume ratios and high interfacial reactivity. Freedom to functionalize nanocomposites with various chemical groups increases their affinity toward target pollutants, which is highly desirable for the selective extraction of target analytes in complex environmental matrixes. This book presents the recent progress in the field of nanocomposites and their properties, fabrication methods and applications for pollution control and

sensing It discusses the advances in pollution control techniques made possible because of nanocomposites and focuses on environment friendly and efficient approaches The text also covers economic toxicological and regulatory issues and research trends
