

A 'typical' pathology report after breast cancer

Section of Report	Description
Macroscopic Description	This is what the pathologist sees by looking at the tissue sample with the naked eye. It also describes what sort of tissue was provided by the surgeon (for example, tissue from a core biopsy, a mastectomy, or lymph nodes). The location – where the cancer is in the breast.
Microscopic Examination	This is what the pathologist records after looking at sections of your tissue under a microscope. It is a summary of all the information needed by your treating doctors. The type – some types of breast cancer have a better outcome than others. The grade – this indicates the patterns of the cancer cell growth and how fast the cancer cells are growing. The grade is numbered from 1 to 3: – <i>Grade 1 (Low Grade or Well Differentiated)</i> cancer cells still look a lot like normal cells. They are usually slow growing and are likely to behave less aggressively. – <i>Grade 2 (Intermediate/Moderate Grade or Moderately Differentiated)</i> cancer cells do not look like normal cells. They are growing somewhat faster than normal cells. – <i>Grade 3 (High Grade or Poorly Differentiated)</i> cancer cells do not look at all like normal cells. This means the cells are growing more quickly and are more likely to be aggressive. The 'Stage' of the breast cancer – this indicates the size of the tumour and whether the cancer has spread. Low stage cancers are small and have not spread to the lymph glands or beyond. High stage cancers have spread beyond the breast and lymph glands to other parts of the body. Whether the margin is clear – the surgeon will remove your breast cancer, and some healthy looking tissue around it, to ensure that the cancer is completely removed from the breast. The healthy looking tissue is called the surgical margin. If the edge of the surgical margin is not 'clear' of breast cancer cells, you may need to have more surgery. Lymph nodes - the report shows whether there are cancer cells in the lymph nodes in your armpit (axilla) or near your breast. This information is used to 'stage' the cancer. Hormone receptors – the report shows if hormone receptors are present on your breast cancer. This will affect whether hormonal therapies are recommended for you. There are two types of hormone receptors – oestrogen (ER) and progesterone (PR). HER2 status – the report shows if there are HER2 receptors on your breast cancer. HER2 is a protein on a cell that allows growth factors to bind to the cell, causing the cell to divide. HER2 is also called HER2-neu or c-erbB2. If you have these receptors, you may have particular treatments recommended for you, such as Herceptin. Ki-67 – Ki-67 is a protein in cells that increases when cells are dividing. The report shows the percentage of cancer cells that contain Ki-67. The more positive cells there are, the more quickly the cancer is dividing and growing.
Summary and diagnosis	This is a summary of the above information, as well as a diagnosis. For example, "Invasive carcinoma of no special type, grade 2, 17mm diameter, clear surgical margins, with no evidence of axillary lymph node involvement."
