Ocean optics is a branch of oceanography which is firmly embedded in studies of a great variety of ocean science and engineering questions. The interactive nature between radiative transfer of light and various dissolved and particulate constituents of seawater is at the core of ocean optics science and applications. The transfer of radiant solar energy has vital implications to life and climate on Earth and the large variety of subjects of ocean optics ranges from the subtle problems of physical optics to optical remote sensing towards a better understanding of ocean biology, biogeochemistry and ecosystems and their roles in the Earth's system processes. The intention of this book is to present a collection of papers that generally share a common denominator of frontier topics in ocean optics which are unique, uncommon or outstanding in the literature and to provide a balanced view of the extraordinary breadth of research in this field. Topics as diverse as measurements and modeling of radiative transfer, light fields, light scattering and polarization, ocean color, benthic optical properties and the use of optics for characterizing seawater constituents are addressed in this book. The book is expected to be of interest and useful to a broad audience of professional ocean scientists, engineers and advanced students with an interest in ocean optics and applications of optical methods in oceanography.

Case on Appeal, *IUTAM Symposium on Fluid-Structure Interaction in Ocean Engineering* Edwin Kreuzer, 2008-06-28 Proceedings of the IUTAM Symposium on Fluid

Structure Interaction in Ocean Engineering held in Hamburg July 23-26 2007 The study of gravity driven water waves interacting with fixed or freely floating objects is an active and important field of research in ocean engineering The accurate prediction of large amplitude ship motions or of marine structures in severe seas is still a delicate problem in the field of fluid structure interaction While three dimensional panel methods have reached the state of maturity in linear sea keeping analysis the original problem governed by strongly nonlinear boundary conditions is far from being solved efficiently The principal nonlinearities are associated with the variable wetted surface of the ship hull or the floating body and with the nonlinear hydrodynamic conditions on the free surface Moreover marine structures often must be modelled as multibody systems rather than a single body This causes additional problems due to wave slamming on floating and fixed structures Furthermore problems such as coupled structural behavior of submerged or floating systems as well as various wind effects have to be considered for the proper design of offshore systems This book collects contributions from leading scientists working on the following topics Ocean waves probabilistic models of sea waves fluid loading on structures including pipes cables drill strings etc behavior of floating systems stability and capsizing of ships coupled structural behavior sloshing in tanks CFD validation and verification
