

UNDERSTANDING DIABETES

What Is Diabetes?
 Diabetes is a chronic condition that affects the way your body uses blood sugar. Blood sugar is a source of energy for your cells. Insulin, a hormone made by the pancreas, helps move blood sugar from the bloodstream into your cells. In people with diabetes, the pancreas either doesn't make enough insulin or the cells don't respond properly to the insulin that is made. This causes blood sugar to build up in the bloodstream. Over time, high blood sugar can damage the heart, blood vessels, eyes, kidneys, and nerves.

Type 1 Diabetes
 Type 1 diabetes is an autoimmune disease in which the body's immune system attacks and destroys the insulin-producing cells in the pancreas. It usually develops in childhood or young adulthood and requires lifelong insulin therapy.

Type 2 Diabetes
 Type 2 diabetes is the most common form of diabetes. It is often associated with obesity and a sedentary lifestyle. The body becomes resistant to insulin, and the pancreas may not produce enough insulin to overcome this resistance.

Potential Complications of Diabetes:

Stroke

Eye Diabetes Complications

Heart Diabetes Complications

Kidney Diabetes Complications

Diabetes Complications

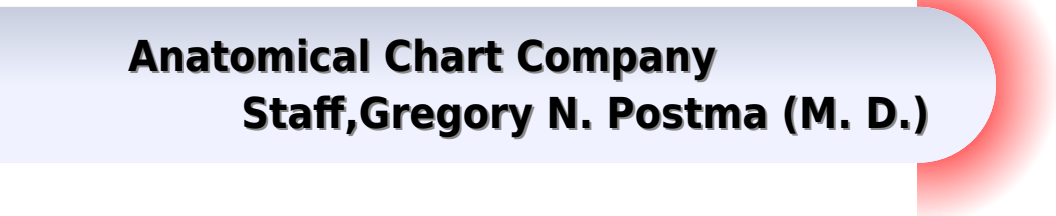

What Are the Symptoms of Diabetes?
 The most common symptoms of diabetes are increased thirst, frequent urination, and unexplained weight loss. Other symptoms include fatigue, blurred vision, and slow-healing sores.

How Is Diabetes Diagnosed?
 Diabetes is diagnosed through blood tests that measure blood sugar levels. A fasting blood sugar test, a random blood sugar test, and an A1C test are commonly used.

What Are the Long-Term Risks of Diabetes?
 Long-term risks of diabetes include heart disease, stroke, kidney failure, blindness, and nerve damage. Managing blood sugar levels can help reduce these risks.
