Abstract— The need of energy is increasing day by day due to increase in domestic and industrial work demand. The energy should be produced from renewable energy sources rather than non-renewable sources. Now countries are developing energy mainly from renewable sources. Among them mostly are not quick and fast processes. But tidal energy can give rapid production of electricity using underwater windmill. In this research paper, review on production of energy through underwater windmill, its types, technology, challenges, literature work has been studied. The challenges can be overcome in this technology by change in design, material and environment.

Keywords: Renewable energy, wind mill, tidal energy, electricity

I. INTRODUCTION

In this modern era issue of energy generation is demand of energy is increasing rapidly, subsequently global warming also increasing. There are various methods for the production of energy like thermal, coal, hydro-plant, geothermal, bio-mass, etc. They include both renewable and non-renewable as well. Renewable energy sources are which can be renewed from time to time; there are various examples of it like hydro energy, solar energy, geothermal energy, etc. Similarly non-renewable sources are those which cannot be renewed, various examples are thermal energy, petroleum energy, nuclear energy, etc. In recent all countries facing various problems like hike in fuel prices, increase in pollution, etc. So government also look for sources that are environment-friendly, affordable, easily available, and with minimum disadvantages as much as possible. Various renewable sources are, Solar Energy, Wind Energy etc.

Solar energy uses the sun's light and heat to induce renewable or 'green' power. The most common form of solar energy is exercised by solar panels or photovoltaic cells. Solar energy is completely natural, sustainable and veritably low conservation.

Fig.1. A solar panel for electricity generation

On the other hand it has a veritably high installation cost, isn't sufficient and most importantly it isn't continuous all the time.

Hydro energy is the form of energy that could be exercised through the movement of water to power ministry or produce electricity. , hydro energy is considered to be a sustainable energy source. It's a veritably effective source of Energy, it produces in large quantum, it's also continuous. It also deals with disadvantages, it needs a veritably large setup, cost, and area, conservation is also veritably high.

Fig.2. Hydro-Power Plant

Wind Energy is the use of wind to drive electric generators through turbines for electrical power. Wind power is sustainable renewable energy source, that has much lower impact on environment.

Underwater Journal and Information Bulletin ,1973 *Ocean Energies* R.H. Charlier,J.R. Justus,1993-09-17 This timely volume provides a comprehensive review of current technology for all ocean energies It opens with an analysis of ocean thermal energy conversion OTEC with and without the use of an intermediate fluid The historical and economic background is reviewed and the geographical areas in which this energy could be utilized are pinpointed The production of hydrogen as a side product and environmental consequences of OTEC plants are looked at The competitiveness of OTEC with conventional sources of energy is analysed Optimisation current research and development potential are also examined Separate chapters provide a detailed examination of other ocean energy sources The possible harnessing of solar ponds ocean currents and power derived from salinity differences is considered There is a fascinating study of marine winds and the question of using the ocean tides as a source of energy is examined focussing on a number of tidal power plant projects including data gathered from China Australia Great Britain Korea and the USSR Wave energy extraction has excited recent interest and activity with a number of experimental pilot plants being built in northern Europe This topic is discussed at length in view of its greater chance of implementation Finally geothermal and biomass energy are considered and an assessment of their future is given Each chapter contains bibliographic references The author has also distinguished between energy schemes which might be valuable in less industrialized regions of the world but uneconomical in the developed countries A large number of illustrations support the text Every effort has been made to ensure that the book is readable and accessible for the specialist as well as the non expert It will be of particular interest to energy economists engineers geologists and oceanographers and to environmentalists and environmental engineers
