Kepert, 2012-12-06 Molecular stereochemistry is a fundamental aspect of all areas of chemistry It is especially important in inorganic chemistry

where the coordination numbers are variable and occasionally quite high. The present book evolved naturally from a series of articles written by Professor Kepert for *Progress in Inorganic Chemistry* elucidating aspects of the stereochemistry of inorganic compounds of coordination numbers 4–12. In the present volume Professor Kepert has added new sections and synthesized these individual chapters into a unified treatment, updating his references when necessary to the most recent contributions in the literature and interweaving the various themes as deemed appropriate. The result is a major contribution describing the stereochemistry of coordination compounds having both unidentate and multidentate ligands. The viability of the repulsion approach to stereochemistry is tested to the limit in this treatise and shown to be an extremely good way of rationalizing a diverse body of data.
