Advances in Dependability Engineering of Complex Systems Wojciech Zamojski, Jacek Mazurkiewicz, Jarosław Sugier, Tomasz Walkowiak, Janusz Kacprzyk, 2017-05-29 This book gathers the proceedings of the 2017 DepCoS RELCOMEX an annual conference series that has been organized by the Department of

Computer Engineering at the Faculty of Electronics Wrocław University of Science and Technology since 2006. Its mission is to continue the heritage of the other two cycles of events: the RELCOMEX conferences 1977-89 and Microcomputer Schools 1985-95, so this year we can celebrate the 40th anniversary of its origins. In contrast to those preceding series which were focused on conventional reliability analysis, the goal of DepCoS is to promote a more comprehensive approach to system performability, which is now commonly called dependability. This innovative research area provides answers to the latest challenges in reliability evaluation for contemporary complex systems. Its novelty is based on a multi-disciplinary approach to system theory, technology, and maintenance of systems operating in real environments. Dependability analyses concentrate on the efficient completion of tasks, services, and jobs by a system considered as a combination of technical information and human assets, in contrast to classical reliability which is generally limited to the analysis of technical resources and associated components and structures. The selection of papers for this volume illustrates the diversity of topics that need to be considered: from mathematical models and design methodologies through software engineering and data security issues to practical engineering problems in technical systems. In addition, this edition of the conference hosted the 7th CrISS DESSERT Workshop, which was devoted to the analysis and assurance of safety and cyber security in critical infrastructure and computer systems.

Artificial Intelligence Margaret A. Boden, 1996-06-20. Artificial Intelligence is the study of how to build or program computers to enable them to do what minds can do. This volume discusses the ways in which computational ideas and computer modeling can aid our understanding of human and animal minds. Major theoretical approaches are outlined, as well as some promising recent developments. Fundamental philosophical questions are discussed along with topics such as the differences between symbolic and connectionist AI, planning and problem solving, knowledge representation, learning, expert systems, vision, natural language, creativity, and human-computer interaction. This volume is suitable for any psychologist, philosopher, or computer scientist wanting to know the current state of the art in this area of cognitive science. Up-to-date account of how computational ideas and techniques are relevant to psychology. Includes discussions of classical symbolic AI, of connectionism, neural nets, of evolutionary programming, and of A-Life. Discusses a wide range of psychology from low-level vision to creativity.

Proceedings, 1995 **Critical Issues in User Interface Systems Engineering** David Benyon, Philippe Palanque, 2012-12-06 This book developed from an IFIP workshop which brought together methods and architecture researchers in Human Computer Interaction and Software Engineering To an extent this introduction is a little unfair to the authors as we have distilled the results of the workshop to give the reader a perspective of the problems within integrated approaches to usability engineering The papers could not hope to address all of the issues however we hope that a framework will help the reader gain further insights into current research and future practice The initial motivation was to bring together researchers and practitioners to exchange their experiences on Graphical User Interface design problems

The two groups represented methodological and architecture tools interests so the workshop focused on intersection of how methods can support user interface development and vice versa how tools architectures and reusable components can empower the design process There is we believe a constructive tension between these two communities Methodologists tend to approach the design problem with task domain organisational analysis while the tool builders suggest design empowerment envisioning as a means of improving the way users work rather than relying on analysis of current systems This debate revolves around the questions of whether users current work is optimal or whether designers have the insight to empower users by creating effective solutions to their problems Tool builders typically want to build something then get the users to try it while the methodologists want to specify something validate it and then build it
