

1. Write the definition of evolution. Give an example.

Evolution is the change in a population over a gradual period of time. Examples: the peppered moths changed colors as their environment changed color.

2. Why does evolution occur? Explain using: natural selection, variation, and random mutations.

Random mutations occur in populations all of the time. Mutations that produce variations (ie white fur instead of brown) sometimes help an organism ADAPT to its environment BETTER. Organisms that are better adapted are more likely to live and produce offspring. Eventually, this trait can take over a population.

3. How does studying embryos give us clues to which organisms are most closely related? Give an example.

Embryos that have the most similarities throughout gestation are most likely more closely related. For example, the rabbit and the human are almost identical up until the third trimester.

4. What is the difference between artificial and natural selection. Give examples of each.

Artificial is driven by humans while natural selection is driven by nature. Dogs are an example of artificial selection while wolves are an example of natural selection.

5. Describe the bunny lab. What made the bunny population grow? Disappear? Change?

In the bunny lab, you could add mutations that enabled the bunnies to better adapt to their environments (ie food sources, habitat, predators). A favorable trait quickly replaced the less favorable one.

6. Below is a phylogeny (tree of common ancestors):

- How are common ancestors indicated? **Intersecting lines.**
- Which organisms are most closely related? **Bear/Chimp**
- Which organisms are least related? **Lamprey/Chimp**
- Which organism is most closely related to a Lamprey? **Sunfish**

7. What is the definition of a species?

A population of animals that can interbreed and produce fertile offspring.

8. Are ligers, zorses, and mules considered their species? Why or why not?

No. They can mate but their offspring are sterile. You cannot breed two ligers and make more ligers.

9. Define "niche" and "competition". Give examples of each.

A "niche" is the role or function of an organism in its environment. "Competition" is a negative interaction between organisms where they are competing for the same limited resource (ie food or shelter). Examples: a predator's "niche" is often to control prey populations. "Competition" occurs between filters who compete and hunt in overlapping territories.

Anonym circa 1996-97 The first idea to write a book on Mathematical Economics more or less ordered in a historical sequence occurred to me in 1995 when I was asked by Istituto dell'Enciclopedia Italiana to write the entry Storia dell'economia matematica for the collective work Storia del XX Secolo. I thought that it would be interesting to elaborate on the text presented to the editors to turn it into a book aiming at giving a panorama of what in my opinion are the main 20th century contributions to mathematical economics. Of course only a narrow set of the contributions made by economic theorists could be included both for space limitations and necessity because of the limited competence of any single author. For instance I have paid very limited attention to what is now called Macroeconomics and also to Game Theory which actually has grown so much as to acquire scientific independence as a living branch of applied mathematics. For the same reason I have also left completely untouched such fields as Mathematical Finance, Public Economics, Theory of Taxation etc. I have always based my presentation on published material only assuming that what is contained in working papers still waits to be confirmed possibly in the first years of the 21st century.

The Encyclopedia Britannica James Louis

Garvin, Franklin Henry Hooper, Warren E. Cox, 1929 The Cumulative Book Index, 1914 **The Species Problem** David N. Stamos, 2003-03-17 In this provocative work David N. Stamos tackles the problem of determining exactly what a biological species is in short whether species are real and the nature of their reality. Although many have written on this topic *The Species Problem* is the only comprehensive single authored book on this central concern of biology. Stamos critically considers the evolution of the three major contemporary views of species: species nominalism, species as classes and species as individuals. Finally he develops his own solution to the species problem, a solution aimed at providing a universal species concept worthy of the Modern Synthesis. This book will be of interest to philosophers of biology and of science in general, to historians of biology and to biologists concerned with one of the most significant and practical conceptual issues in their field.
