

### Masonry Exterior Non-Bearing Wall Design Guide

When a building has a structural frame that supports both the gravity and lateral loads, the perimeter walls are then isolated from the structural frame and only need to provide a barrier between the interior space and the exterior elements. This means these exterior walls only need to resist out-of-plane loads from component and cladding wind and self-weight seismic loads. Masonry makes an excellent option for the exterior wall material as it has advantages over other building materials. To start with, masonry offers durability and security as well as fire and sound control. Additionally, masonry can offer energy savings due to its thermal mass, ungrouted cores can be filled with insulation, and the assembly requires less maintenance than other building materials. The exterior face of masonry can be painted, burnished, rock-faced, or stacked with various bond patterns allowing many aesthetic options while removing the need for other trades/materials to cover up the structure. The prevalence of masonry in many building types clearly demonstrates these architectural and structural advantages are frequently chosen.

When it comes to the design requirements for non-load-bearing masonry walls in the TMS 402 masonry code, there are two options to consider. First is design per the main code body and second is Appendix B for masonry infill. There are differences in these two approaches which can have a significant affect on the design of the wall reinforcement layout and is the focus of the first section of this article followed by detailing of connection to the main structure and finishing with a reinforcement example. For a comparison, there is a companion masonry insight article titled "Appendix B: Non-Participating Masonry Infill" that provides an alternate reinforcement example.

#### Masonry Wall Definitions

To assist with the main discussion of this article, a few select definitions from the TMS 402 code are included here to help ensure everyone is starting at the same point.

**Load-Bearing Wall:** "Wall supporting vertical loads greater than 200 pounds per linear foot in addition to its own weight."

**Shear Wall:** "A wall, load-bearing or non-load-bearing, designed to resist lateral forces acting in the plane of the wall."

**Infill Wall:** "Masonry constructed within the plane of, and bounded by a structural frame".
