

Problem Statement

1 Introduction

There will always be a need for maintenance on mechanical systems and components because of friction and wear. It is however not always as simplistic as "if it breaks, repair it" and in recent years the need for scientific maintenance has increased tremendously. Reasons for this could be the increased sophistication of production equipment, the need for a high return on an investment and the high cost of maintenance.

The objective of an organization's maintenance activities should be to support the production process with maximal levels of availability, reliability, operability and safety at acceptable cost. If this objective is pursued the results will be clearly evident in the form of increased production capacity and thus company profit. As high profit is the reason for the existence of production concerns, maintenance should be regarded in a very serious way.

Various maintenance models exist to act as guidelines for an effective maintenance function. One such model called 'The Maintenance Cycle' is proposed by Coetsee[22] and act as a good overview of the total complicated maintenance function. See Figure 1.1, on the next page.

The maintenance cycle is divided into two orbits namely: (1) The outer cycle which represents the managerial processes in the maintenance organization; and (2) The inner cycle which involves the operational and technical processes. In this dissertation we will focus on maintenance strategy setting, one of the components in the inner cycle.
