Fox, 1999-06 Covers two species *Penaeus monodon* and *Penaeus vannamei* It is organized into three main parts Design Operation and Training The design part focuses on two hatcheries and gives detailed plans of their construction as well as other options The operation portion of the manual details the procedures for most efficient operation of a specific hatchery This manual consists of compiled presently known information important for training new personnel Contains enough detail to provide the newcomer with knowledge to run a hatchery and provides details to assist the experienced hatchery manager Illustrated **Manual on Artemia production and use** Van Stappen, G., Sorgeloos, P., Rombaut, G., 2024-05-31 This FAO publication on brine shrimp is a manual for all those who are using *Artemia* or have an interest in this organism whether as a source of live food in the hatchery as a model organism in research or for other purpose Author It is intended for those who wish to update their knowledge on its biology production or its use but also for those who want to learn about *Artemia* for the first time Author A team of leading *Artemia* experts from around the globe with diverse backgrounds expertise and working in research education and or the industry have jointly contributed to its writing Author This manual presents in a concise form essential information on *Artemia* biology and the most important natural cyst resources that find their way to the aquaculture market Author It also provides detailed information on general principles and practical procedures to produce *Artemia* in ponds and in tank systems Author Finally the manual offers a compilation of state of the art guidelines and methodologies related to the use of this crucial live food organism in aquaculture Author The illustrations tables and practical worksheets will help the reader to implement the correct procedures in the production and use of *Artemia* Author This publication is a must for anyone working with this unique organism Author Health Management and Biosecurity Maintenance in White Shrimp (*Penaeus Vannamei*) Hatcheries in Latin America Food and Agriculture Organization of the United Nations. Inland Water Resources and Aquaculture Service, Food and Agriculture Organization of the United Nations, 2003 This publication contains technical guidance on the effective and responsible operation of shrimp hatcheries in Latin America compiled through an extensive consultative process undertaken during 2001-03 including contributions from government designated national coordinators regional and international experts intergovernmental organisations and the private sector This process was carried out through the FAO Regional Technical Cooperation Programme project which involved the participation of 14 countries of the region *Improving Penaeus Monodon Hatchery Practices*, 2007-01-01 The successful farming of tiger shrimp *Penaeus monodon* in India is mainly due to the existence of some 300 hatcheries whose capacity to produce 12 000 million postlarvae PL annually has provided an assured supply of seed However the sustainability of the sector is still hampered by many problems foremost among these being a reliance on wild caught broodstock whose supply is limited both in quantity and in seasonal availability and that are often infected with pathogens The current low

quality of hatchery produced PL due to infection with white spot syndrome virus WSSV and other pathogens entering the hatcheries via infected broodstock contaminated intake water or other sources due to poor hatchery management practices including inadequate biosecurity is a major obstacle to achieving sustainable shrimp aquaculture in India and the Asia Pacific region. Considering the major contribution of the tiger shrimp to global shrimp production and the economic losses resulting from disease outbreaks, it is essential that the shrimp farming sector invest in good management practices for the production of healthy and quality seed. This document reviews the current state of the Indian shrimp hatchery industry and provides detailed guidance and protocols for improving the productivity, health management, biosecurity and sustainability of the sector. Following a brief review of shrimp hatchery development in India, the major requirements for hatchery production are discussed under the headings: infrastructure, facility maintenance, inlet water quality and treatment, wastewater treatment, biosecurity, standard operating procedures (SOPs), the Hazard Analysis Critical Control Point (HACCP) approach, chemical use during the hatchery production process and health assessment. Pre-spawning procedures covered include the use of wild, domesticated and specific pathogen free (SPF) specific pathogen resistant (SPR) broodstock, broodstock landing centres and holding techniques, broodstock selection, transport, utilization, quarantine, health screening, maturation, nutrition and spawning, egg hatching, nauplius selection, egg nauplius disinfection and washing and holding, disease testing and transportation of nauplii. Post-spawning procedures covered include larval rearing unit preparation, larval rearing, health management, larval nutrition and feed management, important larval diseases, general assessment of larval condition, quality testing, selection of PL for stocking, PL harvest and transportation, nursery rearing, timing of PL stocking, use of multiple species in shrimp hatcheries and documentation and record keeping. Information on the use of chemicals in shrimp hatcheries and examples of various forms for hatchery record keeping are included as Annexes.

Shrimp infectious myonecrosis strategy manual Food and Agriculture Organization of the United Nations, 2019-09-30. This Shrimp infectious myonecrosis strategy manual provides key information for national policy makers relevant to the development of contingency plans for countries, producers and other stakeholders with regard to outbreaks of infectious myonecrosis (IMN), a viral disease of farmed marine penaeid shrimp that is listed by the World Organisation for Animal Health (OIE). IMN is a viral disease discovered in 2002 that has caused substantial mortalities in populations of cultured Pacific whiteleg shrimp *Penaeus vannamei*, initially reported in Brazil (2002) and Indonesia (2006) and recently in India (2016) and Malaysia (2018). The purpose of this manual is to provide support for the various components of a national contingency plan. The information provided includes:

1. the nature of IMN, providing a brief review of disease etiology, susceptible species and global distribution;
2. diagnosis of infection, describing the gross clinical signs of disease, field diagnostic methods, differential and laboratory methods for diagnosis;
3. prevention and treatment, providing information on vaccination and resistance and immunity of the hosts;
4. epidemiology, providing information on IMN's geographic distribution, persistence in the environment, modes of transmission, vectors and reservoir hosts, factors

influencing disease transmission and expression and impact of the disease 5 principles of control and eradication describing the methods and 6 policy development and implementation summarizing the overall policy IMN specific objectives problems overview of response options strategies for eradication and control capacity building and funding and compensation **The Shrimp Book** Victoria Alday-Sanz,2010-12-01 A comprehensive source of information on all aspects of shrimp production this reference covers not only the global status of shrimp farming but also examines shrimp anatomy and physiology From nutrition to health management and harvesting issues to biosecurity this well researched volume evaluates existing knowledge proposes new concepts and questions common practices With an extensive review on worldwide production systems this compilation will be highly relevant to research scientists students and shrimp producers *World Shrimp Culture: pt.1.
