Study the diagrams below. Note the concentrations of the various solutions. The membrane is permeable to both water and glucose.

1. Draw arrows indicating the net movement of each material.
2. Is the solution in the beaker isotonic, hypertonic or hypotonic to the solution in the bag? Label each solution under the picture.
3. Are these substances moving across the membrane by active or passive transport? Explain.
Passive transport. An example is water diffusion.

4. Describe how the appearance of the bag at "A" might change after a period of time has passed.
The bag will shrink after time due to the water leaving.

5. Describe how the appearance of the bag at "B" might change after a period of time has passed.
The bag is going to extend due to the water traveling into the bag.

6. Describe how the appearance of the bag at "C" might change after a period of time has passed.
The bag is going to stay the same due to the isotonic solution.

7. What will happen to the movement of water and glucose when both sides of the membrane have reached equilibrium? **The solution will be isotonic at the 'same strength'.**

8. What molecule is largely responsible for the changes in volume of these bags?

The red blood cells in your blood must constantly be in an isotonic condition. A 0.9% salt solution is isotonic to red blood cells.

9. Draw a simple sketch of a red blood cell in an isotonic solution. Label the inside and the outside of the cell with the correct concentrations of salt and water. **The amount of water going into the cell is the same as the amount going out of the cell. The salt inside the cell is the same as the solution outside.**

membranes the kinetics of facilitated diffusion and cotransport systems The primary active transport systems are considered emphasizing the pumping of an ion sodium potassium calcium or proton against its electrochemical gradient during the coupled progress of a chemical reaction while a conformational change of the pump enzyme takes place This book is of interest to advanced undergraduate students as well as to graduate students and researchers in biochemistry physiology pharmacology and biophysics *The Movement of Molecules Across Cell Membranes* Wilfred D. Tosteson, 2012-03-23 This second Volume in the series on Membrane Transport in Biology contains a group of essays on transport across single biological membranes separating the inside and outside of cells or organelles We have not attempted to include material on all types of plasma and intracellular membranes but rather have emphasized structures which have been studied relatively thoroughly Four chapters describe transport of different types of molecules and ions across the plasma membranes of mammalian red cells Two essays concern the excitable membranes of nerve and muscle cells while the remaining four chapters treat transport across several types of intracellular membranes Water makes up more than two thirds of the mass of most living cells The transport of water between the inside and outside of cells and organelles is important for the function of these structures As a result of investigations in many laboratories over the past four decades our picture of the water permeability of the red cell membranes is rather detailed when compared to the water permeability of other biological membranes In Chapter 1 R I Macey describes this picture and also considers the permeability of red cell membranes to non electrolytes including metabolic substrates such as sugars amino acids purines and nucleosides **Membrane Transport**, 2000-06-15 Membrane Transport is targeted towards researchers with an interest in the mechanism of solute transport across biological membranes Its scope is broad ranging from the techniques required to study transport itself through the expression purification and reconstitution of transporters to techniques for investigation of their structures As such it not only proves the necessary technical grounding for newcomers to the field but should also be of value to old hands wishing to get up to date with recent developments in these areas While some of the approaches described require sophisticated equipment e g a stopped flow fluorimeter most of the protocols can be implemented in any well found laboratory Preparation of this volume comes at a time when a result of genome sequencing our knowledge of membrane transporter sequences is far outstripping our understanding of their molecular mechanisms Our hope is that this book will help future researchers to redress this imbalance **A Model for Passive Transport Across the Cell Membrane of Excitable Tissue** Jack Fromkin, 1974 Cell Membrane Transport Z.I. Cabantchik, R. Deves, S. Peren, D.L. Yudilevich, 2013-06-29 Experimental science is a complicated creature At the head there is a Gordian knot of ideas and hypotheses behind is the accumulated mass of decades of research Only the laboratory methods the legs which propel science forward remain firmly in touch with the ground

Growth however is uneven dinosaurs develop by solid means to give a vast body of results but few ideas Others sprint briefly to success with brilliant though ill supported ideas The problems which this book addresses is to maintain an organic unity between new ideas and the current profusion of innovative experimental tools Only then can we have the framework on which our research thoughts may flourish The contributors are outstanding scientists in their respective fields and they record here in a clear manner the methodology with which they perform their experiments They also illustrate some of their most exciting findings In all chapters the emphasis is on the critical analysis of the methodology which is often avoided in refereed Journals These techniques are explained in this book in adequate detail Each chapter is extensively referenced and contains the most recent material available from author s laboratory at the time of going to press *Transport across biological membranes* Milan Hofer,1981 **Tests of Theories of Transport Across Cell Membranes Using Inhibitors of the Choline and Glucose Transport Systems of the Human Red Cell** P. A. W. Edwards,1973 Intracellular

Transport Katherine Brehme Warren,2014-05-12 Intracellular Transport is a collection of papers that examines the processes of and the mechanisms underlying intracellular transport One paper describes that all active transport processes in the amoeba are intracellular and depend on dynamic transformations of membrane into cytoplasm and of cytoplasm into membrane Another paper discusses the kinetics of membrane transport of which the phenomena of counterflow can become a mobile carrier system The paper notes that the specific transport properties of membranes are conferred by the proteins of the surfaces that are grouped as macromolecular complexes probably similar to those of enzymes One paper describes the concept of parametric pumping an oscillation driven separation process as a possible model for active transport in biological cells Another paper compares the fine scale diffusion effects that happen in a mixture without large scale concentration gradients and where the effect are on a large scale The homogenous kinetic law can be used in the large scale situation the law already can account for any of the fine scale diffusion effects The paper notes that without large scale concentration gradients the transport event is from a local region to a nearby reaction site only Where the effects are on a large scale the diffusion results in a gross transport of over distances larger than molecular dimensions This collection can prove useful for mathematicians cellular biologists physical chemists physiologists electron microscopists geneticists and engineers
