

Visual Basic® for Applications 2016 Introduction

Visual Basic for Applications (VBA) is the programming language, or code, used to automate tasks in Microsoft Office applications. You can manually compose your own VBA code or have it created for you by recording actions in either case, the code is played back to repeat tasks which, when strung together, automate an entire procedure.

Showing the Developer Tab

Always display the DEVELOPER tab as it provides quick access to macros, VBA code and related security settings.

1. Choose **FILE > OPTIONS > CUSTOMIZE > RIBBONS**.
2. [Click] the **DEVELOPER** checkbox in the right side of the **CUSTOMIZE THE RIBBONS** column and [Click] OK.

Setting Macro Security

1. Choose **DEVELOPER > Macro Security**.
2. Choose one of the **MACRO SETTINGS**, then [Click] OK. Tip: Use the **Enable All Macros** option when working on your own code.

Organizing VBA Projects

The VBA Editor, contained within each Office application, is used to create and organize VBA code. Its left-side Project Explorer pane lists, in tree style view, a Project, representing the open Office file, plus associated Object or Module folders.

- The **Objects** folder lists an open file's documents, Microsoft Word Objects.
- The **Modules** folder lists modules, filled with user created VBA code.
- The code is displayed in a larger pane to the right.
- Code created for a document only applies to that document, while module code applies to any document in the project.

1. Press <ALT-F11> or choose **DEVELOPER > VISUAL BASIC**.
2. Open the left-side Project Explorer pane. If necessary, use **VBA > PROJECT > EXPLORER** or <Ctrl-R>.

Opening or Creating Code Windows

1. [Double Click] any Project Explorer item to open its code window. If necessary, first open its containing folder by [Clicking] the folder's "+".
2. [Right Click] any Project Explorer item and choose **INSERT > MODULE** to create a new module.

Project Explorer's tree view is different for each Office application. For example, PowerPoint has no Objects folder, while Excel has a separate object for each worksheet. The naming convention is:

- **Excel**: Project name = <Workbook name> or <Personal.xlsb>, Object name = <Worksheet name>

- **Word**: Project name = <Document name> or <Normal>, Object name = <TheDocument>.
- **Access**: Project name = <Database file name>, Object name = <Name of form or report>.
- **PowerPoint**: Project name = <PowerPoint file name>.
- **Modules**: all module windows are named Module1 (2, 3, ...)

Deleting a Code Window

1. [Right Click] an object or module name in Project Explorer and select **REMOVE (window name)**...
2. [Click] NO from the pop-up message unless you want to export the code for safekeeping.

Creating VBA Code

1. Open an existing code window or add a new module.
2. Position the cursor at the code insertion point, if necessary, and choose **INSERT > PROCEDURE**:
 - a. Enter a NAME (see **Code Name Rules**).
 - b. Select SUB to automate tasks with a Subroutine, or FUNCTION to perform customized calculations.
 - c. Select PUBLIC to make your code globally available to any subroutine. PRIVATE will restrict its use to the subroutine being created or modified.
 - d. Select 'All local variables as Static' to retain the value of the procedure's variables after code execution ends (e.g., done a running total).
 - e. [Click] OK.
3. Enter your code in an organized way (see **Organizing Code**).
4. Choose **FILE > SAVE** (see **Saving Code**).

Tip: Save time writing code in Excel or Word by recording actions in a Macro, then copying the recorded code to your module.

Running VBA Code

Manually

1. Choose **DEVELOPER > MACROS**.
 2. [Click] the subroutine name in the **MACRO NAME** list. If the list is too long, restrict it to a specific location from the **MACROS IN** list.
 3. [Click] one of action buttons on the right side:
 - Run** - Runs the code to completion.
 - STEP INTO** - Runs one code line at a time to help you catch errors. For details, see **Troubleshooting**.
 - EDIT** - Displays the window code.
 - DELETE** - Deletes the subroutine.
- OPTIONS** - Useful for creating a keyboard shortcut to run the subroutine.

Automatically

VBA subroutines can be triggered by events, but by other subroutines, or start when an Office program starts.

- See **Understanding the VBA Language, Using Code Window Lists and Useful Code Events** for examples of event triggering.
- Add the code <Ctrl> <Open> (or <document> <open>) to run a subroutine from within another subroutine.
- To automatically run code upon opening a document or workbook, create a subroutine called **Document_Open()** or **Workbook_Open()** in Word's TheDocument code window or a subroutine called **Workbook_Open()** in Excel's TheWorkbook code window. Tip: To run a subroutine automatically when an Access database opens, see the steps listed in <http://www.it-ebooks.info/vba>.

Saving Code

Code can only be saved by saving the Office file it is stored in. (Default file types for Excel, Word or PowerPoint ("*.xls", "*.docx", "*.pptx") cannot contain macros, therefore in these programs:

1. Choose **FILE > SAVE** or press <Ctrl-S>.
2. If a "macro free" warning message pops up, [Click] NO.
3. Change **SAVE AS TYPE** to **MACRO ENABLED ("*.xls", "*.docx", "*.pptx")**.
4. Choose a location, specify a FILE NAME, then [Click] SAVE.

Saving Global Macros

Macros, recorded in Excel or Word can be used to be available only to the current workbook/document, or globally for all workbooks or documents. To save a recorded macro globally choose the following from the **STORE MACRO IN** drop list in the **RECORD MACRO** dialog box:

- In Excel, choose **PERSONAL > MACRO WORKBOOK**.
- In Word, don't change the default **ALL DOCUMENTS (NORMAL.DOTM)** choice.
- VBA code can also be saved globally if it is manually created under the **NORMAL** project in Word or the **PERSONAL.VBS** project in Excel.

Code Name Rules

- Code names must begin with a letter.
- Subsequent characters should only be letters, numbers, or underscore characters.
- Good practice makes names shorter than 25 characters and substitutes underscores for spaces.
- Avoid names that are the same as cell references in Excel or restricted VBA keywords such as ISAMOUNT.

VBA Editor Tips

- The Project Explorer pane is best used to navigate between code windows.
- Use the code window's Procedure drop list (see **Navigating Code Window Lists**) to navigate between subroutines in a long code window.
- [Click] the Project Explorer folder icon (📁) at the top of its pane to toggle between a grouped list (Folder) and a straight list. Making this change in any one Office application will affect all Office applications.
- To maximize the code window, close all other windows and panes.
- To directly edit a name in Excel or Word, press <Alt-F11>, select the macro name, then [Click] EDIT.
- Press <Alt-Q> to close the VBA Editor and return to its Office application.

Using Code Window Lists

Object List	Procedure List

The Object and Procedure drop lists at the top of any code window. They can be used to navigate between subroutines or create event-triggered code.

1. Select an appropriate item from the Object drop list.
2. Then select an appropriate item from the Procedure drop list.
3. Write code into the newly created subroutine. For example, a subroutine can be created to validate Access form data, with entered entries reported, before the form is saved. Select the **BEFORECLOSE** event from the **PROCEDURE** list at the top of the form's code window. A new subroutine is automatically created called **Sub Form1_BeforeClose (Cancel As Integer), Insert validation code and it will run just before the form's contents are saved.**

Navigating Code Window Lists

Object List Items

- GENERAL**: Displays all existing subroutine and function procedures.
- WORKSHEET > WORKBOOK**: Displays code for the selected Excel worksheet or workbook.
- DOCUMENT**: Displays code for a selected Word document.
- [Name of Control]**: Displays code for the Access object or sub-object within the selected form or report.

Procedure List Items

- DECLARATIONS**: To jump to a code window's Declarations area above the first procedure.
- [Event Name]**: To create a procedure or to display code that acts on the selected object.
- [Procedure Name]**: To navigate to an existing procedure within a code window.

Useful Keyboard Shortcuts

- Shift + F10**: Hold this key down while opening an Office application and its AutoOpen code will be bypassed.
- Ctrl-Break**: Stops running code. This key combination is particularly useful in halting infinite loops.
- Shift-F2**: Displays the VBA Editor Object Browser definition of an object, method, or property selected in a code window.
- Alt-F8**: Display a list of macros in Excel or Word.

Visual Basic Emma William, 2021-05-10 The goals of this book Cover programming topics as well as Visual Basic Traditional textbooks do a pretty good job of teaching the basics of a given programming language but they often do not cover relevant programming topics that are incidental to the language For example books will omit sections on programming style common pitfalls debugging good bad programming practices and testing Consequently by the time you finish the book you may understand how to program in a language but you might also have picked up bad habits that will come back to bite you later One of the goals of these tutorials is to make sure that all of these incidental topics are covered along the way in the sections where it naturally makes sense to discuss them When you finish you will not only know how to program in Visual Basic you will know how NOT to program in Visual Basic which is arguably as important Provide a lot of examples Most people learn as much or more from following the examples as they do from reading the text These tutorials will endeavor to provide plenty of clear concise examples to show how to apply the concepts you are learning We will also avoid as much as possible the twin evils the magic hand wave also known as where in the interest of space part of an example is omitted and the unexplained new concept where a new concept that is integral to the example is introduced without any mention of what it is or how it works Both of these tend to lead to getting stuck Provide practice programs The end of many lessons and sections will contain some exercises that you can attempt to answer on your own along with solutions You can compare your solution against ours to see what we did differently or if you get stuck how we solved the problem Then you can go back and refocus on the areas you need more work on Most importantly have fun Programming can be a lot of fun and if you re not generally having fun you re not in the right mindset to be programming Tired or unhappy programmers make mistakes and debugging code tends to take much longer than writing it correctly in the first place Often you can save yourself some time by going to bed getting a good night s sleep and coming back to a problem in the morning **Beginning VB.NET** Richard Blair, Jonathan Crossland, Matthew Reynolds, Thearon Willis, 2004-08-18 What is this book about Visual Basic .NET is the latest version of the most widely used programming language in the world popular with professional developers and complete beginners alike This book will teach you Visual Basic .NET from first principles You ll quickly and easily learn how to write Visual Basic .NET code and create attractive windows and forms for the users of your applications To get you started on the road to professional development you ll also learn about object oriented programming creating your own controls working with databases creating menus and working with graphics This second edition has been thoroughly tested on the full release version of .NET The book is written in the proven Wrox beginning style with clear explanations and plenty of code samples Every new concept is explained thoroughly with Try It Out examples and there are end of chapter questions to test yourself What does this book cover In this book you will learn how to Install Visual Basic .NET Write Visual Basic .NET code
