

TEK 8.11A: Food Webs & Symbiosis

TEK 8.11A: Describe producer/consumer, predator/prey, and parasite/host relationships as they occur in food webs within marine, freshwater, and terrestrial ecosystems.

Energy Roles & Food Webs

□ It is essential for each organism in an ecosystem to have a source of energy to survive. In all land and most aquatic ecosystems, the original source of energy supporting all life is radiant (electromagnetic) energy from the Sun.

□ **Producers** are the organisms that have the ability to obtain energy from a non-living source such as the Sun or deep-sea volcanic vents. On land and in shallow aquatic ecosystems, plants are the producers that create food for the rest of the ecosystem through the process of **photosynthesis**. In this chemical reaction, carbon dioxide (CO₂) and water (H₂O) (the reactants) are broken down and recombined into sugar (C₆H₁₂O₆) and oxygen (O₂) (the products).

□ In deep-sea ecosystems near volcanic vents and in rock, there are organisms called **chemotrophs** that can use chemical energy instead of radiant energy to survive. The chemical reaction varies with the ecosystem, but generally uses available chemical energy to make food in a process called **chemosynthesis**.

□ An organism that uses photosynthesis or chemosynthesis to produce food is also known as an **autotroph**, which means "self-feeding".

□ **Consumers** (also called **heterotrophs**) are organisms that cannot make their own food. They obtain their food by eating producers. Consumers can further be classified by what they eat:

- **Omnivores** eat both plant and animals. Examples of omnivores are humans and bears.
- **Herbivores** eat only plants. Examples of herbivores are cows and antelope.
- **Scavengers** are animals that eat the bodies of already dead animals. A buzzard is an example of a scavenger.
- **Carnivores** only eat other animals that they have killed. Examples of carnivores are wolves and lions. Some animals that are usually carnivores may also eat dead animals they find. Examples of carnivores that may act as a scavenger are coyotes and hawks.

□ **Decomposers** are organisms that break down waste and dead organisms not already eaten by scavengers, so that the life-essential elements and compounds can be returned to the environment. The two main classes of decomposers are bacteria and fungi.

□ The energy role of an organism, shown by its position in a food web, is called its **trophic level**. In land ecosystems, there are usually four trophic levels: producer,

1st level consumer, 2nd level consumer and 3rd level consumer. Producers produce the food to support themselves and everyone above them in the food web. The 1st level consumers eat the producers. The 2nd level consumers eat the 1st level consumers, and the 3rd level consumers eat the 2nd level consumers.

□ Animals can occupy more than one trophic level, depending on what they eat. For example, humans are both a 1st and 2nd level consumer when they eat a hamburger. The bun, lettuce and tomato are all plants, making the human a 1st level consumer. The
