AYYILDIZ,2023-12-16 The book titled Prediction of Stock Market Index Movements with Machine Learning focuses on the performance of machine learning methods in forecasting the future movements of stock market indexes and identifying the most advantageous methods that can be used across different stock exchanges In this context applications have been conducted on both developed and emerging market stock exchanges The stock market indexes of developed countries such as NYSE 100 NIKKEI 225 FTSE 100 CAC 40 DAX 30 FTSE MIB TSX and the stock market indexes of emerging countries such as SSE BOVESPA RTS NIFTY 50 IDX IPC and BIST 100 were selected The movement directions of these stock market indexes were predicted using decision trees random forests k nearest neighbors naive Bayes logistic regression support vector machines and artificial neural networks methods Daily dataset from 01 01 2012 to 31 12 2021 along with technical indicators were used as input data for analysis According to the results obtained it was determined that artificial neural networks were the most effective method during the examined period Alongside artificial neural networks logistic regression

and support vector machines methods were found to predict the movement direction of all indexes with an accuracy of over 70%. Additionally, it was noted that while artificial neural networks were identified as the best method, they did not necessarily achieve the highest accuracy for all indexes. In this context, it was established that the performance of the examined methods varied among countries and indexes but did not differ based on the development levels of the countries. As a conclusion, artificial neural networks, logistic regression, and support vector machines methods are recommended as the most advantageous approaches for predicting stock market index movements.

Algorithms for Worst-Case Design and Applications to Risk Management Berç Rustem,Melendres Howe,2009-02-09 Recognizing that robust decision making is vital in risk management this book provides concepts and algorithms for computing the best decision in view of the worst case scenario The main tool used is minimax which ensures robust policies with guaranteed optimal performance that will improve further if the worst case is not realized The applications considered are drawn from finance but the design and algorithms presented are equally applicable to problems of economic policy engineering design and other areas of decision making Critically worst case design addresses not only Armageddon type uncertainty Indeed the determination of the worst case becomes nontrivial when faced with numerous possibly infinite and reasonably likely rival scenarios Optimality does not depend on any single scenario but on all the scenarios under consideration Worst case optimal decisions provide guaranteed optimal performance for systems operating within the specified scenario range indicating the uncertainty The noninferiority of minimax solutions which also offer the possibility of multiple maxima ensures this optimality Worst case design is not intended to necessarily replace expected value optimization when the underlying uncertainty is stochastic However wise decision making requires the justification of policies based on expected value optimization in view of the worst case scenario Conversely the cost of the assured performance provided by robust worst case decision making needs to be evaluated relative to optimal expected
