For a safe repair, the puncture must be 1/2 inch away or more from the edge of the tire tread where the internal steel belt begins. Any puncture less than 1/2 inch from the start of the internal steel belt on the shoulder or sidewall of the tire cannot be repaired (highlighted in red).

A tire patch, by itself, is never a suitable repair. Proper tire repair procedures dictate that the injury must first be completely filled with a suitable vulcanizing material or solid rubber stem. Then, to complete the fix a patch must then be applied to the inner liner.

Techtirerepairs.com

When repairing tires, puncture repairs are limited to the Crown (T-T) area of the tire. The maximum size is dependent upon the type of tire being repaired. Passenger and fabric body ply LT tires have a maximum puncture repair size of 1/4" (6mm) after damage removal. Steel body ply LT, medium and heavy truck tires have a maximum puncture repair size of 3/8" (10mm) after damage removal.

In order to perform a proper, permanent puncture repair on a tire, the following steps must always be used:

- Removal of the tire from the rim so proper inspection may be performed
- Removal of the damaged material with a carbide cutter
- Buffing the inner liner to a #1 or #2 buffed texture
- Fill the injury with a vulcanizing rubber stem (or rope rubber in a heat cure application)
- Reinforce and seal the injury with a repair unit
- **NEVER use a plug only or patch only repair**
