Using OpenMP#The Next Step Ruud Van Der Pas, Eric Stotzer, Christian Terboven, 2017-10-30. A guide to the most recent advanced features of the widely used OpenMP parallel programming model with coverage of major features in OpenMP 4.5. This book offers an up-to-date practical tutorial on advanced features in the widely used OpenMP parallel programming model. Building on the previous volume *Using OpenMP: Portable Shared Memory Parallel Programming* (MIT Press), this book goes beyond the fundamentals to focus on what has been changed and added to OpenMP since the 2.5 specifications. It emphasizes four major and advanced areas: thread affinity (keeping threads close to their data), accelerators (special hardware to speed up certain operations), tasking (to parallelize algorithms with a less regular execution flow), and SIMD hardware-assisted operations on vectors. As in the earlier volume, the focus is on practical usage with major new features primarily introduced by example. Examples are restricted to C and C++ but are straightforward enough to be understood by Fortran programmers. After a brief recap of OpenMP 2.5, the book reviews enhancements introduced since 2.5. It then discusses in detail tasking, a major functionality enhancement; Non-Uniform Memory Access (NUMA) architectures supported by OpenMP; SIMD or Single Instruction Multiple Data heterogeneous systems; a new parallel programming model to offload computation to accelerators; and the expected further development of OpenMP.
