The Measurement of Intelligence Lewis Madison Terman, 1916 The constant and growing use of the Binet Simon intelligence scale in public schools institutions for defectives reform schools juvenile courts and police courts is sufficient evidence of the intrinsic worth of the method It is generally recognized however that the serviceableness of the scale has hitherto been seriously limited both by the lack of a sufficiently detailed guide and by a number of recognized imperfections in the scale itself The Stanford revision and extension has been worked out for the purpose of correcting as many as possible of these imperfections and it is here presented with a rather minute description of the method as a whole and of the individual tests The aim has been to present the explanations and instructions so clearly and in such an untechnical form as to make the book of use not only to the psychologist but also to the rank and file of teachers physicians and social workers More particularly it is designed as a text for use in normal schools colleges and teachers reading circles

Neuropsychology Gerald Goldstein, Paul David Nussbaum, Sue R. Beers, 2013-06-29 In this volume of the series Human Brain Function Assessment and Rehabilitation we cover the area of how brain function is assessed with behavioral or neuropsychological instruments These assessments are typically conducted by clinical neuropsychologists or behavioral neurologists and so we made an effort to present the somewhat differing approaches to these two related disciplines Clinical neuropsychologists are psychologists who typically utilize standardized tests while behavioral neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation Both approaches have much to offer The basic assumption of neuropsychological assessment is that the brain is the organ of behavior and therefore the condition of the brain may be evaluated with behavioral measures Neuropsychological tests are those measures found by research to be particularly sensitive to alterations in brain function

An adequate neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function. Over the years these objective measures have changed but generally involve documentation through direct observation of brain tissue or through histological pathological neuroimaging or other laboratory procedures. The methods described in the first two volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests.
