Structural Wood Design Abi Aghayere, Jason Vigil, 2017-04-28 This text

provides a concise and practical guide to timber design using both the Allowable Stress Design and the Load and Resistance Factor Design methods. It suits students in civil structural and construction engineering programs as well as engineering technology and architecture programs and also serves as a valuable resource for the practicing engineer. The examples based on real world design problems reflect a holistic view of the design process that better equip the reader for timber design in practice. This new edition now includes the LRFD method with some design examples using LRFD for joists, girders and axially load members. It is based on the 2015 NDS and 2015 IBC model code. It includes a more in depth discussion of framing and framing systems commonly used in practice such as metal plate connected trusses, rafter and collar tie framing and pre engineered framing. It includes sample drawings, drawing notes and specifications that might typically be used in practice. It includes updated floor joist span charts that are more practical and are easy to use. It includes a chapter on practical considerations covering topics like flitch beams, wood poles used for footings, reinforcement of existing structures and historical data on wood properties. It includes a section on long span and high rise wood structures. It includes an enhanced student design project.

Design of Prestressed Concrete to Eurocode 2 Raymond Ian Gilbert, Neil Colin

Mickleborough, Gianluca Ranzi, 2017-01-27

The design of structures in general and prestressed concrete structures in particular requires considerably more information than is contained in building codes. A sound understanding of structural behaviour at all stages of loading is essential. This textbook presents a detailed description and explanation of the behaviour of prestressed concrete members and structures both at service loads and at ultimate loads and in doing so provide a comprehensive and up to date guide to structural design. Much of the text is based on first principles and relies only on the principles of mechanics and the properties of concrete and steel with numerous worked examples. However where the design requirements are code specific this book refers to the provisions of Eurocode 2 Design of Concrete Structures and where possible the notation is the same as in Eurocode 2. A parallel volume is written to the Australian Standard for Concrete Structures AS3600 2009. The text runs from an introduction to the fundamentals to in depth treatments of more advanced topics in modern prestressed concrete structures. It suits senior undergraduate and graduate students and also practising engineers who want comprehensive introduction to the design of prestressed concrete structures. It retains the clear and concise explanations and the easy to read style of the first edition but the content has been extensively re organised and considerably expanded and updated. New chapters cover design procedures, actions and loads, prestressing systems and construction requirements, connections and detailing and design concepts for prestressed concrete bridges. The topic of serviceability is developed extensively throughout. All the authors have been researching and teaching the behaviour and design of prestressed concrete structures for over thirty five years and the proposed new edition of the book reflects this wealth of experience. The work has also gained much from Professor Gilbert active and long time involvement in the development of standards for concrete buildings and concrete bridges.
