

Predicting Inheritance: Dihybrid Crosses

- **Monohybrid crosses** look at how the alleles of **one gene** transfer across generations
- **Dihybrid crosses** look at how the alleles of **two genes** transfer across generations
- The genetic diagrams for both types of crosses are very similar
- There are several more genotypes and phenotypes involved
- When writing the different genotypes write the two alleles for one gene, followed immediately by the two alleles for the other gene. **Do not mix up the alleles from the different genes**
 - If there was a gene with alleles **Y** and **y** and another gene with alleles **G** and **g** an example genotype for an individual would be **YYGg**

Worked example: Dihybrid genetic diagram

- Horses have a single gene for coat colour that has two alleles:
 - **B**, a dominant allele produces a black coat
 - **b**, a recessive allele produces a chestnut coat
- Horses also have single gene for eye colour
 - **E**, a dominant allele produces brown eyes
 - **e**, a recessive allele produces blue eyes
- In this example a horse which is **heterozygous** for **both genes** has been crossed with a horse that is **homozygous** for **one gene** and **heterozygous** for the **other**

Parental phenotypes: black coat, brown eyes x chestnut coat, brown eyes

Parental genotypes: **BbEe**

bbEe

Parental gametes: **BE** or **Be** or **bE** or **be**

bE or **be**
