Getting Started

Use *Getting Started* to elicit students' ideas about the main topic. The goal of *Getting Started* is not to seek closure (i.e., the "right answer"), but to find out what your students know and think about Earth systems. By the end of the chapter, students will have developed more detailed and accurate understandings about minerals, rocks, structures, and the Earth system.

Students' responses to the first question (What are the major geologic features in your region?) will demonstrate the extent of their knowledge of local geology and about geology in general. In areas where major landforms occur, such as mountains, canyons, valleys, cliffs, or volcanoes, students will probably describe these first. Because of their vertical extent, such landforms typically allow for the rocks that form them to be more easily observed. Thus, students may be able to describe some of the geology that surrounds them in the context of rocks and landforms. Where relief and exposures are less common, students may not know much about the rocks and structures that exist beneath their feet. By the time they enter high school, most students have heard the words igneous, sedimentary, and metamorphic. If students have

had the experience of examining rocks within their region, they might be able to provide simple descriptions of the local geologic setting. Students may also draw on smaller-scale geologic processes that are active parts of the rock cycle. For example, regions dominated by rivers and slopes are part of sedimentary rock-forming pathways that generate more subtle landforms as well as affecting rock formation.

Minerals, Rocks, and Structures

Getting Started

Have you ever seen the debris left behind by a creek or river after overflowing its banks? Maybe you have seen the shape of a beach changed after a storm. In the news, you might have heard about mudslides triggered by an earthquake or the eruption of a volcano somewhere on Earth. All these are relatively small-scale changes to the physical features at the surface of the crust. Now, imagine the effects of thousands upon thousands of smaller-scale changes over geologic time. What types of changes do you think could result from many smaller-scale changes added together? Could all these changes produce effects as large as those caused by plate tectonics and the movement of continents and ocean basins?

Think about the rocks that you can see in your community. At first glance, they may not seem as if they have changed or can change very much. However, these rocks would "tell a different story" if you connected them to the rocks thousands of meters down below your feet. This "story" would cover hundreds of millions of years of geologic history. That is enough time to include some very large-scale changes. You might even see changes that you never could have imagined happening to your region.

Reconstructing the geologic past of your community can help you understand the geology of where you live. It will also help you understand connections between the Earth's systems. To do so, you must learn to "read the story" in the rocks. Think about the following:

- What are the major geologic features in your region?
- How old are these features?
- How did the features form?
- What do they tell about the region's history and how it developed?

What do you think? Write down your ideas about these questions in your Geo-log. Be prepared to discuss your ideas with your small group and the class.

Students' responses to the second question (How old are these features?) will provide you with important information about their knowledge and beliefs about when the rocks and structures within their region formed. Expect a variety of answers ranging from thousands to many billions of years. The basis for answering the question will range from knowledge (students should already know the age of the planet from the *Astronomy*

Snyder, 2016-04-11 This is the Student Study Guide Solutions Manual to accompany Organic Chemistry 12th Edition The 12th edition of Organic Chemistry continues Solomons Fryhle Snyder's tradition of excellence in teaching and preparing students for success in the organic classroom and beyond A central theme of the authors' approach to organic chemistry is to emphasize the relationship between structure and reactivity To accomplish this the content is organized in a way that combines the most useful features of a functional group approach with one largely based on reaction mechanisms The authors' philosophy is to emphasize mechanisms and their common aspects as often as possible and at the same time use

the unifying features of functional groups as the basis for most chapters The structural aspects of the authors approach show students what organic chemistry is Mechanistic aspects of their approach show students how it works And wherever an opportunity arises the authors show students what it does in living systems and the physical world around us **Super Course in Chemistry for the IIT-JEE: Inorganic Chemistry , Organic Chemistry, Study Guide** T.
