

White Paper: Hydraulic Press Calculations

Calculating pressure on a hydraulic press used for laminating panels (hot or cold) can be very tedious and confusing when multiple units are being used.

There are two major systems of measurement (English and Metric), both of which have numerous units to express length, area, force and pressure. In order to simplify these calculations all measurements should be converted into either all metric or English units shown below:

	<u>Metric (SI)</u>	<u>English</u>
Length	cm	inch
Area	cm ²	in ²
Force	kg	lb
Pressure	kg/cm ²	psi (lb/in ²)

Trying to use two different measurement systems and alternate units for length, area, pressure not only causes confusion but greatly increases the chance for calculation errors.

A hydraulic press is designed so that a very large force is applied to a panel. This force is then applied evenly to the panels in the press. It is important to know three of the four values in the following equation.

$$\text{Hydraulic Line Pressure} \times \text{Total Cylinder Area} = \text{Glue Line Pressure} \times \text{Total Panel Area}$$

Hydraulic Gauge (Line) Pressure: This is the value seen on the machine's pressure gauge. The pressure unit is typically measured in bars (metric) or psi (English). On most presses, the maximum pressure will be no more than 200 bar or 3,000 psi.

<u>To Convert from</u>	<u>Conversion Factors</u> <u>To</u>	<u>Multiply by</u>
bar	kg/cm ²	1.02
kg/cm ²	bar	0.98
bar	psi	14.5
kg/cm ²	psi	14.22
psi	kg/cm ²	0.0703
