

RNA AND PROTEIN BUILDING

RNA is produced in the nucleus of a cell whereas that of the mitochondria that carry its information. Thus RNA is a specific component of basic, complex, from the DNA that contains the informational genetic message to the cytoplasm. Thus it is called messenger RNA (mRNA). As the information mRNA directs the building of proteins. Proteins are made up of specific polypeptide and polypeptide units. How does a cell construct the proper amino acids into protein molecules? Production of proteins molecules require help of RNA. Transfer RNA (tRNA) brings specific amino acids to mRNA according to their code sequence and forms bound mRNA.

As this investigation, you will

1. Use paper models for three base base changes in mRNA, such as poly-uracil sequence from changes in tRNA.
2. Use paper models to show how mRNA molecules bring specific amino acid molecules to the ribosome where building of proteins occurs.
3. Examine translation in DNA code to a mRNA's message and construct the mRNA code the DNA's amino acid code.
4. Study the molecular basis of protein synthesis.

PART II: RNA Transcription

Can you use the mRNA molecules models (not only using model bases) in B.B.B.2000-2010 Slide Sheet 3. Using the DNA code construct the code model in the B.B.B.2000-2010 DNA and RNA code change the phenotypic life's space to change part of the DNA, along the base pair pairs of amino acid and sugar in the base pairs. Using the left side of your DNA model other side that has the sequence: cytosine, thymine, guanine, adenine, guanine and cytosine, use a protein model RNA molecules with the paper molecules of the DNA code.

1. For the RNA building sequence, study in the model of the DNA sequence. Now, the DNA code using bases, are most probably paired in the DNA sequence. This is because of the sequence of bases.

Remember the RNA molecules are the DNA code. Thus the DNA molecules have up with the original sugar code (DNA sequence) "copy" component, during RNA production.
