

## Geometric Patterns 3 to 6

All of these are concerned with the basic idea of dividing a circle into a number of equal parts, a topic which has an important place in much geometrical work, called **cyclotomy**.

**cyclotomy** is the topic concerned with dividing the circumference of a circle into equal parts, using geometrical constructions which involve the use of only a pair of compasses and a straight-edge; the measuring of lengths or angles is not allowed. The early Greek mathematicians knew it was possible for cases where the number of divisions was  $2^n$ , 3 or 5 and all other numbers obtained by multiplying any two of those together. So it was known to be possible for 2, 3, 4, 5, 6, 8, 10, 12, 15, ... divisions. The problem of whether other divisions might be possible was unresolved until Gauss (who started on the problem when aged 19) proved that it was possible to construct  $(2^n) + 1$  divisions provided only that the expression yielded a prime. That added 17, 257 and 65537 ( $n = 2, 3, 4$ ) to the list.

Now it is one thing to know it can be done, but quite another to actually do it, and the constructions are so involved that they are useless for all practical drawing purposes. Also, why not use all the tools at our disposal?

The easiest and most well-known of the circle divisions is into 6 equal parts by using the radius of the circle itself (that is the unaltered setting of the compass), and the "flower pattern", shown on the right, made by the 6 intersecting arcs must be the most widely drawn pattern of all, as it is nearly always seen by those practising the skill of using a compass. Just marking the off the circumference into 6 equal parts and joining them up in order to make a regular hexagon should follow.

Having got the initial idea of using compasses to step-off the distances around the circle, it is a logical move to think about stepping-off other distances. Suppose we wish to divide the circle into 5 equal parts. Since 5 is less than 6 the steps will need to be bigger (won't they? - try asking first). How much bigger? There is only one way to find out - do it. A period of 'trial and adjustment' now starts, but it needs to be done in an orderly manner. Patience is needed. Open out the compasses a little, make a starting mark, and step around the circle making as faint a mark as possible, counting as you go. The 5th mark should coincide with the starting mark. When it doesn't, use the difference to adjust the setting on the compass, don't just yank at them savagely! First off, note the direction they have to be moved. If the distance is short they need to be opened, if it went past the starting mark then they have to be closed. But further than that, we can estimate the amount by which they need to be altered, it is one-fifth of the error. If it all sounds very simple and obvious, just wait until your class tries out this technique!

In case this seems unnecessarily complicated, it isn't. It has the merits of being easily understood, applicable to all cases (whatever the number of divisions) and extremely accurate. Of course that amount of accuracy may not be necessary but, if it is, it cannot be achieved any other way - unless you can measure angles to at least 0.1 of a degree. A test of accuracy would be the requirement to draw the 13-point circle and all its diagonals, as on the front page of this unit, and see that all those small triangles appeared. It perhaps needs to be said that such work requires very good drawing instruments, especially a pair of needle-point dividers with a fine-adjustment facility, if it is to be done by hand. The usual basic school compass with a blunt pencil does not rate highly for doing the best work. Of course, a good computer drawing program, with its ability to draw angles to an accuracy of 0.01° makes it much easier!

Having 'mastered' the technique, or by using the appropriate templates from those given at the back of this unit, some work based on sheets 3 to 6 could be done.
