Smith,1994-08-01 Proposing a new paradigm for Computer Supported Cooperative Work CSCW this ground breaking book presents a research agenda for developing and testing that paradigm It constitutes the first attempt to outline a comprehensive model of collaboration that integrates the cognitive conceptual and social dynamics of groups The challenge faced by all groups engaged in intellectual work is on the one hand to divide the task so that efforts of individual members may proceed in parallel and on the other hand to synthesize their separate contributions to form a coherent whole Addressing this challenge Smith examines the general form of a theory of computer based collaboration that extends across different tasks and working situations He uses the work of Newell Simon and Anderson as a base from which to consider a group as a form of distributed information processing system Within groups there are constructs analogous to human long term and short term memory conceptual processes and problem solving and knowledge construction strategies He discusses two metacognitive issues awareness and control as they occur in collaborative behavior And he reviews a number of advanced computer systems that support collaboration focusing on their impact on the thinking and behavior of groups Smith's theoretical framework combines elements of Information Processing System theory and its detailed process models of cognitive behavior with the situated perspective of activity theory The book suggests new and useful ways of conceiving problems and solutions to all those interested in the ways in which people interact with each other and with computers to achieve goals Vibration Control For Optomechanical Systems Vyacheslav M Ryaboy,2021-11-29 Vibration presents a major challenge to advanced experiments and technological processes in engineering physics and life sciences that rely on optics and optoelectronics This compendium discusses ways in which vibration may affect optical performance and describes methods and means of reducing this impact Principal methods of vibration control namely damping and isolation are highlighted using mathematical models and real life examples The unique text covers some topics that are important for optomechanical applications but are lacking in general vibration texts such as dynamics and stability of elastically supported

systems with high centers of gravity physics of pneumatic isolators and application of dynamic absorbers to vibration isolated systems This useful reference book enables the reader to apply the vibration control tools properly and perform basic analytical and experimental tasks of estimating and verifying their performance It is also a must have textbook for undergraduate or graduate level courses in vibration control and optomechanics Related Link s *Intelligent Decision Technology Support in Practice* Jeffrey W.
