

The SMW System

Mixing self-hardening slurry in-situ with native soil (SMW) is a cost-effective technique for the construction of walls for groundwater control (cut-off walls), walls for excavation support (retaining walls) as well as for ground improvement.

For walls with shallow depths (typically 6 to 15 m) the BAUER Soil Mixing Wall method (SMW) has been developed. The soil is loosened and immediately mixed with a self-hardening suspension by three adjacent slightly overlapping augers and mixing paddles.

By loosening, conveying and mixing of the soil, minimum friction between rods and mixed soil is ensured. Therefore it is possible to construct walls effectively rigs with medium power supply.

At the same time a very homogeneous soil-cement mixture can be ensured in order to achieve a good quality of the wall.

Main advantages of the method are:

- Small to medium size rigs can be used.
- The in-situ soil is used as a construction material
- Very little generation of spoil (important factor in contaminated areas)
- No vibrations induced during construction (SMW can be used in immediate vicinity to buildings)
