Edible Oleogels Alejandro G. Marangoni, Nissim Garti, 2015-08-24 In an effort to provide alternatives to trans and saturated fats scientists have been busy modifying the physical properties of oils to resemble those of fats In this fashion many food products requiring a specific texture and rheology can be made with these novel oil based materials without causing significant changes to final product quality The major approach to form these materials is to incorporate specific molecules polymers amphiphiles waxes into the oil components that will alter the physical properties of the oil so that its fluidity will decrease and the rheological properties will be similar to those of fats These new oilbased materials are referred to as oil gels or oleogels and this emerging technology is the focus of many scientific investigations geared toward helping decrease the incidence of obesity and cardiovascular disease Presents a novel strategy to eliminate trans fats from our diets and avoid excessive amounts of saturated fat by structuring oil to make it behave like crystalline fat Reviews recent advances in the structuring of edible oils to form new mesoscale and nanoscale structures including nanofibers mesophases and functionalized crystals and crystalline particles Identifies evidence on how to develop trans fat free low saturate functional shortenings for the food industry that could make a major impact on the health characteristics of the foods we consume

Thermodynamics of Solutions Eli Ruckenstein, Ivan L. Shulgin, 2009-06-17 This book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade Even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book First these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hydrogen bonding between components or systems with large differences in the partial molar volumes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures Second the conventional thermodynamic methods are not sufficient for the accurate treatment of these mixtures Last but not least these systems are of interest for the pharmaceutical biomedical and related industries In order to meet the thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation theory of Kirkwood and Buff and *ab initio* quantum mechanical techniques The Kirkwood Buff KB theory is a rigorous formalism which is free of any of the approximations usually used in the thermodynamic treatment of multicomponent systems This theory appears to be very fruitful when applied to the above mentioned difficult systems
