

## P. Sci. Waves **Key**

Put all answers on a separate sheet of notebook paper.

1. Mechanical waves need a medium through which to transport energy.
2. The particles in a surface water wave move in a circle (back-&-forth / up & down).
3. Waves in which the particles of medium move at right angles to the direction of the wave are transverse waves.
4. The wavelength of a wave is measured from the crest of one wave to the crest of the next.
5. If the wavelength of a given wave decreases, you know that its frequency will increase.
6. Two waves have the same frequency and wavelength, but the first wave has a greater amplitude. The energy of the first wave greater than that of the second.
7. Wave A has a greater frequency than wave B, but the amplitude of the two waves is the same. The energy of wave A is equal to that of wave B.
8. The unit for frequency is the hertz.
9. A wave will travel only as long as it has energy to carry.
10. When you squeeze together the coils of a spring and then release them, you are creating a compressional wave.
11. Waves in which the particles of the medium move only in the same direction as the motion of the wave are compressional waves.
12. You are creating a wave on a spring. If you start shaking the spring more slowly, the wavelength of the resulting wave will increase.
13. If you are lying on a raft, and you notice that the number of waves that go past the raft increases, you also find that the distance between each crest decreases.
14. Wave A carries more energy than wave B. Wave B has a smaller amplitude than wave A.
15. The energy a wave carries is measured by its amplitude.
16. For a given wave, if the frequency doubles, the wavelength is halved.
17. When a wave passes from a less dense medium to a more dense medium, the speed may change.
18. Repeating disturbances that transfer energy through matter or space are waves.

19. The two types of mechanical waves are transverse and compressional (longitudinal).
20. If the frequency of a water wave changes, its wavelength must also change.
21. The symbol  $\lambda$  (lambda) stands for the wavelength.

Figure 11-1

22. In Figure 11-1, identify the following structures:  
B wavelength, A crest, C amplitude
23. Speed can be determined by dividing the distance traveled by the time. The water waves in a lake travel 4.4 m in 2.0 s. What is the speed of the waves?  $y = d/t$   $v = 4.4\text{m} / 2.0\text{s}$   $v = 2.2\text{ m/s}$
24. An ocean wave has a frequency of 2.0 Hz with a wavelength of 10 m. What is the velocity of the wave?  $v = f \times \lambda$   $v = 2.0\text{ Hz} \times 10\text{ m}$   
 $v = 20\text{ m/s}$

25. The wavelength of the wave in the diagram is 1.5 m.
26. The amplitude of the above wave is 0.5 m.
27. A man is standing on the shore of a beach, up to his knees in water. Every 5 seconds a wave breaks on him. What is the period of the wave? 5 seconds

**Time And Science - Volume 3: Physical Sciences And Cosmology** Remy Lestienne, Paul Harris, 2023-06-22 The present volume of Time and Science series is devoted to Physical Sciences and Cosmology Today more than ever the question is Time an ontological property a necessary ingredient for the physical description of the world or a purely epistemological element relative to our situation in the world worry physicists and cosmologists alike For many of them Relativity and particularly General Relativity as well as its reconciliation with quantum mechanics in the elaboration of a quantum theory of gravitation points to a negative answer to the first alternative and leads them to deny the objective reality of time For others the answer is nuanced by the evidence of an emerging temporal property when one climbs the scales of the complexity of systems and or the applicability of the statistical laws of thermodynamics But for some the illusion of the unreality of time comes from certain confusions that they denounce and plead for the re-establishment of time at the heart of physical theories **Mathematics for the Physical Sciences** Leslie Copley, 2015-03-30 The book begins with a thorough introduction to complex analysis which is then used to understand the properties of ordinary differential equations and their solutions The latter are obtained in both series and integral representations Integral transforms are introduced providing an opportunity to complement complex analysis with techniques that flow from an algebraic approach This moves naturally into a discussion of eigenvalue

and boundary value problems A thorough discussion of multi dimensional boundary value problems then introduces the reader to the fundamental partial differential equations and special functions of mathematical physics Moving to non homogeneous boundary value problems the reader is presented with an analysis of Green's functions from both analytical and algebraic points of view This leads to a concluding chapter on integral equations
