

Water Treatment Testing

Directions:

You will need a beaker of tap water, a pH probe, a conductivity probe, and a turbidity probe attached to an interface connected to a computer with Logger Pro. You will also need distilled water to help calibrate the turbidity probe and the Internet and textbook for research. Looking at the materials and lab we will be using, what are the safety precautions we should take to protect ourselves and materials during the investigation?

- 1) Rinse off your pH probe and then place it in your water sample and gently stir. The pH probe will take some time to even out, so have some patience. Once it levels out, compare your measurement to the EPA Standards seen in Data Table 1. Then fill out the right side of Data Table 1 for pH.
- 2) Take your conductivity probe and place it into the water sample. Make sure the units for the probe are set for mg/L. Compare your measurement to EPA Standards seen in Data Table 1. Then fill out the right side of Data Table 1 for Total Dissolved Solids using the measurement you got from the conductivity probe.
- 3) Turbidity sensors need to be calibrated each time they are used. Use the instructions that come with the probe to calibrate it before using the probe. Then place your water sample in the vial at the appropriate level (at the white line). Ensure the outside is wiped clean with lens paper and there are no bubbles in the water sample. If either of these happens, you will have an error in your reading. Compare your measurement to the EPA Standards in Data Table 1. Then fill out the right side of Data Table 1 for turbidity.

Data Table 1

Contaminant	EPA Standard	Your Measurement	Did it meet EPA Standard?
pH	6.5-8.5		
Total Dissolved Solids	< 500 mg/L		
Turbidity	< 5 NTU
