Section: Water Use and Management

Read the passage below and answer the questions that follow.

Industry accounts for 19 percent of water used in the world. Water is used to manufacture goods, to dispose of waste, and to generate power. The amount of water needed to manufacture everyday items can be astounding. For instance, nearly 1,000 L of water are needed to produce 1 kg of aluminum, and almost 500,000 L of water are needed to manufacture a car. Vast amounts of water are required to produce computer chips and semiconductors.

Most of the water that is used in industry is used to cool power plants. Power-plant cooling systems usually pump water from a surface water source such as a river or lake, carry the water through pipes in a cooling tower, and then pump the water back into the source. The water that is returned is usually warmer than the source, but it is generally clean and can be used again.

IDENTIFYING MAIN IDEAS

One reading skill is the ability to identify the main idea of a passage. The main idea is the main focus or key idea. Frequently, a main idea is accompanied by supporting information that offers detailed facts about main ideas.

In the space provided, write the letter of the term or phrase that best completes each statement or best answers each question.

- _____ 1. How much water is needed to manufacture a car?
a. 50,000 L. c. 1,000 L.
b. 500,000 L. d. 100,000 L.
- _____ 2. The amount of water used in the world for industry is
a. 500,000 L. c. 19 percent.
b. vast amounts. d. 1,000 L.
- _____ 3. Water is used in industry mainly to
a. cool power plants. c. create steam, which is then used
for energy. d. clean huge cooling towers.
b. keep machinery running.
- _____ 4. Water that is returned to a river from a power plant cooling tower is
a. cooler than the river and contaminated.
b. warmer than the river and contaminated.
c. cooler than the river but clean.
d. warmer than the river but clean.

[Ecological Modeling For Mitigating Environmental And Climate Shocks: Achieving The Unsds](#) Hock Lye Koh,Su Yean Teh,2021-07-08 Lakes wetlands and coastal regions provide essential services critical to the survival of human wildlife and by and large the ecosystems which are constantly threatened by anthropogenic activities environmental degradation and climate change Marine resources particularly mangroves and corals are vulnerable to coastal developments including coastal reclamation and human settlements that discharge large quantities of wastes into the seas

Climate change impacts such as increased salt intrusion and sea level rise may additionally induce regime shifts detrimental to these delicate ecosystems. And the warmer climate has increased the frequency, duration and intensity of catastrophic coastal disturbances implicating profound uncertainty to the sustainability of coastal infrastructures and resources essential for human populations. This book is written for students, researchers and practitioners pursuing teaching and research related to sustainable development and the United Nations Sustainable Development Goals (UNSDGs). It provides a unique approach on sustainable development viewed from the perspectives of providing solutions via model simulation to solve sustainable development issues related to human population growth and impacts due to climate change. It provides the scientific knowledge and technical skills necessary to achieve valuable insights for mitigating the predicted adverse impacts and for developing sustainable development strategies incorporating climate and environmental adaptations.

Questions and Answers in Environmental Science S.K. Basu, Amit Krishna De, 2005. The Sustainable Future Of Humankind Lies In Understanding The Earth And Its Environment. For this reason, Environmental Science has a purview that overlaps several other disciplines from biology to economics, geology to sociology. Every subject has a significant relationship with some area of environmental science. However, it is often difficult, time consuming and exhaustive to keep pace with new trends in such a broad-based field.

Hydrological Models for Environmental Management Mikhail V. Bolgov, Lars Gottschalk, Irina Krasovskaia, Robert J. Moore, 2012-12-06. This book contains a selection of papers from a NATO Advanced Research Workshop entitled 'Stochastic models of hydrological processes and their applications to problems of environmental preservation' convened in Moscow over the period 23-27 November 1998. The Workshop was unique in providing the first opportunity for over a decade for countries of the Russian Federation to interact with other countries across the world to discuss hydrological science issues relevant to environmental management. The contrasting schools of thought within the Russian Federation and with other countries proved a fascinating and valuable experience for those fortunate enough to attend. The scientific content of the Workshop was motivated by a number of concerns: Water is a key natural resource whose modelling and management is made complex by its inherent spatial unevenness and time variability. Traditional methods for investigating hydrological processes in nature employ stochastic modelling and forecasting. However, these are not well developed with regard to i) representing the characteristics of hydrological regimes and ii) investigating the influence of water factors on processes which arise in biological systems and those involving hydrochemical, geophysical and other processes.
