

Wave Worksheet

One full wave (cycle)

Wave train – two or more waves

Amplitude – measures the energy of a transverse wave

- measured from the resting position to the top of a crest or the bottom of a trough (see vertical arrow)

Wavelength – length of a single wave cycle (horizontal arrow double sided arrow)

Frequency – # of waves that pass a point in a given amount of time

Speed = wavelength x frequency

The time from the beginning to the end of the wave train in each situation is 1 second.

Wave 1

- a) How many waves are there in this wave train? _____
- b) Wavelength _____ cm c) Amplitude _____ cm d) frequency _____ Hz e) speed _____ cm/s

Wave 2

- a) How many waves are there in this wave train? _____
- b) Wavelength _____ cm c) Amplitude _____ cm d) frequency _____ Hz e.) speed _____ cm/s

Problems:

1. What is the wavelength of a sound wave with a frequency of 50 Hz? The speed of sound is 342 m/s.
2. A sound wave in a steel rail has a frequency of 620 Hz and a wavelength of 10.5 m. What is the speed of sound in steel?

An Introduction to the Mathematical Theory of Waves Roger Knobel, 2000 This book is based on an undergraduate course taught at the IAS Park City Mathematics Institute Utah on linear and nonlinear waves The first part of

the text overviews the concept of a wave describes one dimensional waves using functions of two variables provides an introduction to partial differential equations and discusses computer aided visualization techniques The second part of the book discusses traveling waves leading to a description of solitary waves and soliton solutions of the Klein Gordon and Korteweg deVries equations The wave equation is derived to model the small vibrations of a taut string and solutions are constructed via d'Alembert's formula and Fourier series The last part of the book discusses waves arising from conservation laws After deriving and discussing the scalar conservation law its solution is described using the method of characteristics leading to the formation of shock and rarefaction waves Applications of these concepts are then given for models of traffic flow The intent of this book is to create a text suitable for independent study by undergraduate students in mathematics engineering and science The content of the book is meant to be self contained requiring no special reference material Access to computer software such as MathematicaR MATLABR or MapleR is recommended but not necessary Scripts for MATLAB applications will be available via the Web Exercises are given within the text to allow further practice with selected topics

Ochi,2005-07-21 Waves observed in the ocean are extremely irregular and from a physics standpoint it seems impossible to describe this chaotic situation Scientists can describe the situation by means of a stochastic approach This book describes the stochastic method for ocean wave analysis This method provides a route to predicting the characteristics of random ocean waves information vital for the design and safe operation of ships and ocean structures Assuming a basic knowledge of probability theory the book begins with a

chapter describing the essential elements of wind generated random seas from the stochastic point of view The following three chapters introduce spectral analysis techniques probabilistic predictions of wave amplitudes wave height and periodicity A further four chapters discuss sea severity extreme sea state the directional wave energy spreading in random seas and special wave events such as wave breaking and group phenomena Finally the stochastic properties of non Gaussian waves are presented Useful appendices and an extensive reference list are included Examples of practical applications of the theories presented can be found throughout the text This book will be suitable as a text for graduate students of naval ocean and coastal engineering It will also serve as a useful reference for research scientists and engineers working in this field
