

Lewis Structures and VSEPR (Valence Shell Electron Pair Repulsion Theory) POGIL

Model 1: Formal Charge

- Gives the rough estimate of the charge distribution in molecules
 - An imbalance of charge leads to 'hot spots' of excess negative and/or positive charge in a molecule
 - Molecules with a larger imbalance in charge are less favored
- Assumes the bonding is purely nonpolar covalent
- Formal charges on the atoms will add up to the overall charge on the molecule

$$FC = \#ve - (\# e^- \text{ in lone pairs} + e^- \text{ obtained from dividing bonds equally between atoms})$$

$$FC = \#ve - \# \text{ bonds} - \# e^- \text{ in lone pairs (unshared electrons)}$$

1. Calculate the formal charge on each atom and the overall charge for each of the structures given below:

Experienced users of cooperative learning demonstrate how they use it in settings as varied as a developmental mathematics course at a community college and graduate courses in history and the sciences and how it works in small and large classes as well as in hybrid and online environments. The authors describe the application of cooperative learning in biology, economics, educational psychology, financial accounting, general chemistry and literature at remedial, introductory and graduate levels. The chapters showcase cooperative learning in action at the same time introducing the reader to major principles such as individual accountability, positive interdependence, heterogeneous teams, group processing and social or leadership skills. The authors build upon and cross reference each other's chapters describing particular methods and activities in detail. They explain how and why they may differ about

specific practices while exemplifying reflective approaches to teaching that never fail to address important assessment issues
