

Biology Unit 5 Exam Study Guide
DNA, RNA, and Protein Synthesis

1. Define the following:

codon: a codon is three nitrogenous bases located on the mRNA that code for one of the twenty specific amino acids.

anticodon: an anticodon is three nitrogenous bases located on the tRNA that attach to the mRNA.

purine: a purine is a nucleotide that contains adenine or guanine. These two nitrogenous bases have single ringed structure

pyrimidine: a pyrimidine is a nucleotide that contains the bases thymine or cytosine. These two nitrogenous bases contain a double ringed structure.

point mutation: a point mutation occurs when a nitrogenous base is switched for a different nitrogenous base. For every codon that is changed, the resultant amino acid could change. Only one amino acid could possibly change as a result of a single point mutation.

frameshift mutation: a frameshift mutation is caused by the insertion or deletion of a nitrogenous base in a DNA sequence. This type of mutation results in a shift in the reading pattern of the DNA and in multiple new amino acids. This type of mutation is more dangerous than a point mutation.

2. What are the differences between DNA and RNA:

DNA	RNA
Base pairs: ATCG	Base Pairs: AUCG
Sugar: deoxyribose	Sugar: ribose
Structural differences: double strand, deoxyribose sugar, contains thymine instead of uracil	Structural differences: single strand, ribose sugar, contains uracil instead of thymine

3. What are the three parts of a nucleotide:

Phosphate group, nitrogenous base, ribose or deoxyribose sugar

4. Explain the purpose and where each process takes place:

Transcription	Translation
Purpose: to copy the DNA in the form of mRNA. Transcription results in a copy (message) of the DNA that will eventually be the blueprint for the cell's proteins that are constructed.	Purpose: to read the message sent from the nucleus and construct proteins that the cell requires.
Where does this take place: nucleus	Where does this take place: ribosomes

5. What are the roles of the following in protein synthesis?

-DNA: DNA provides the instructions for making the cell's proteins
