Study Title Efficacy Of Several Antimicrobial Processing Aids:

Antimicrobials in Food P. Michael Davidson, T. Matthew Taylor, Jairus R. D. David, 2020-11-10 Fifteen years have passed since the 3rd edition of Antimicrobials in Food was published. It was arguably considered the must-have reference for those needing information on chemical antimicrobials used in foods. In the years since the last edition, the food industry has undergone radical transformations because of changes on several fronts. Reported consumer demands for the use of natural and clean label antimicrobials have increased significantly. The discovery of new foodborne pathogen niches and potentially hazardous foods along with a critical need to reduce food spoilage waste has increased the need for suitable antimicrobial compounds or systems. Novel natural antimicrobials continue to be discovered and new research has been carried out on traditional compounds. These and other related issues led the editors to develop the 4th edition of Antimicrobials in Food. In the 4th edition, the editors have compiled contemporary topics with information synthesized from internationally recognized authorities in their fields. In addition to updated information, new chapters have been added in this latest release with content on the use of bacteriophages, lauric arginate ester, and various systems for antimicrobial encapsulation and delivery. Comprehensive revisions of landmark chapters in previous editions, including naturally occurring antimicrobials from both animal and plant sources, methods for determining antimicrobial activity, new approaches to multifactorial food preservation or hurdle technology, and mechanisms of action, resistance, and stress adaptation are included. Complementing these topics is new information on quantifying the capability of clean antimicrobials for food preservation when compared to traditional food preservatives and industry considerations when antimicrobials are evaluated for use in food manufacture. Features: Covers all food antimicrobials, natural and synthetic, with the latest research on each type. Contains 5,000 references on every conceivable food antimicrobial. Guides in the selection of appropriate additives for specific food products. Includes innovations in antimicrobial delivery technologies and the use of multifactorial food preservation with antimicrobials.

Decontamination of Fresh and Minimally Processed Produce Vicente M. Gómez-López, 2012-05-01 Attempts to provide safer and higher quality fresh and minimally processed produce have given rise to a wide variety of decontamination methods, each of which have been extensively researched in recent years. Decontamination of Fresh and Minimally Processed Produce is the first book to provide a systematic view of the different types of decontaminants for fresh and minimally processed produce. By describing the different effects, microbiological, sensory, nutritional, and toxicological, of decontamination treatments, a team of internationally respected authors reveals not only the impact of decontaminants on food safety but also on microbial spoilage, vegetable physiology, sensory quality, nutritional and phytochemical content, and shelf life. Regulatory and toxicological issues are also addressed. The book first examines how produce becomes contaminated, the surface characteristics of produce related to bacterial attachment, biofilm formation, and resistance, and sublethal damage and its implications for decontamination. After reviewing how produce is washed and minimally processed, the various

decontamination methods are then explored in depth in terms of definition generation devices microbial inactivation mechanisms and effects on food safety Decontaminants covered include chlorine electrolyzed oxidizing water chlorine dioxide ozone hydrogen peroxide peroxyacetic acid essential oils and edible films and coatings Other decontamination methods addressed are biological strategies bacteriophages protective cultures bacteriocins and quorum sensing and physical methods mild heat continuous UV light ionizing radiation and various combinations of these methods through hurdle technology The book concludes with descriptions of post decontamination methods related to storage such as modified atmosphere packaging the cold chain and modeling tools for predicting microbial growth and inactivation The many methods and effects of decontamination are detailed enabling industry professionals to understand the available state of the art methods and select the most suitable approach for their purposes The book serves as a compendium of information for food researchers and students of pre and postharvest technology food microbiology and food technology in general The structure of the book allows easy comparisons among methods and searching information by microorganism produce and quality traits
